

CHIPS 82C574 MICROCHANNEL INTERFACE CHIP

- Compatible with IBM Microchannel specifications
- Provides highly integrated Microchannel interface solution
- Flexible Card ID assignment
- Supports POS registers
- Resource relocation capability to avoid address conflict
- Flexible Interrupt level selection
- Sophisticated Card Channel Ready signal generator.
- Two modes of operation:
Mode 1 for general purpose 8 bit slave I/O peripherals
- Mode 0 for 82C570 CHIPSLINK application
- Low power CMOS technology
- 68 pins PLCC package

The 82C574 is a highly integrated Microchannel interface chip for IBM PS/2 personal computer application. It can be configured to operate in either of two modes; "mode 0" for 82C570 CHIPSLINK 3270 coaxial protocol controller or "mode 1" for the 8 bit general purpose IO slave peripherals.

When **mode 0** is selected, the chip decodes the IO address of 02DXH and 022XH for IBM & IRMA registers and generates the IORD, IOWR signals for 82C570. It also decodes the memory space of 0CE000 to 0CFFFF for the display buffer and external micro code access by activating the MEMRD, MEMWR signals.

In **mode 1** operation, the 82C574 supports the microchannel bus interface to most 8 bit IO slave devices. The adapter IO address can be programmable during the setup procedure. This resource relocation capability avoids conflicts with the adapter's address. The interrupt level can also be selected via software. The 82C574 greatly simplifies the circuitry to interface to the microchannel bus.

The 82C574 is fabricated using advanced CMOS technology and is packaged in a 68 pin PLCC.

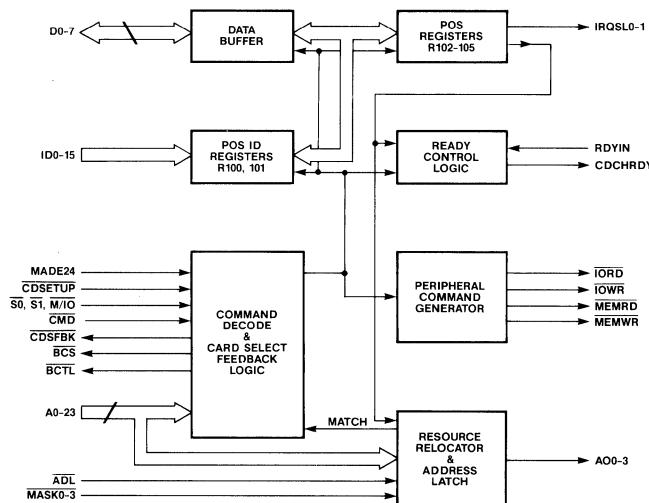

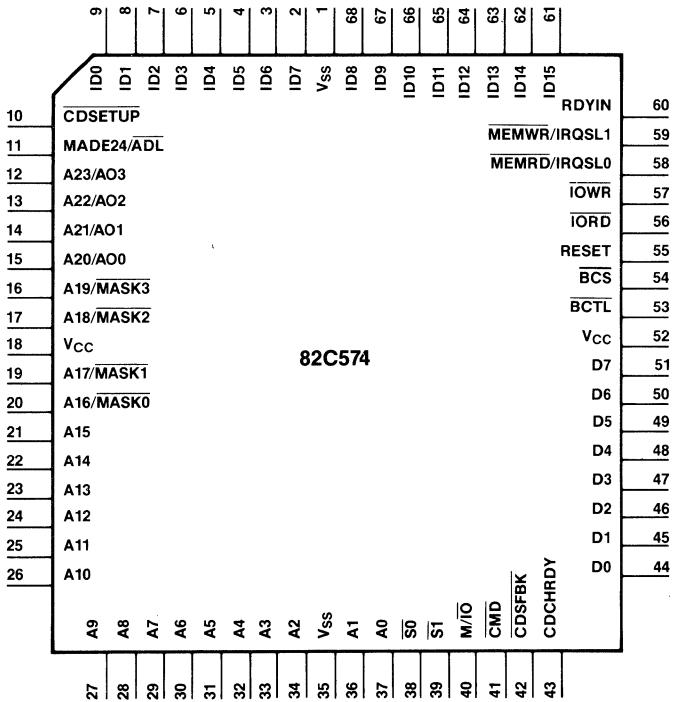

Figure 1. 82C574 Functional Block Diagram

82C574 Pin Description

Pin No.	Pin Type	Symbol	Description																																				
61-68 2-9	I	ID15-8 ID7-0	Adapter Identification bits 15 to 0. ID15 is the most significant bit (MSB) and ID0 is the least significant bit (LSB). The user can select each bit to be 0 or 1 by tying the pin to VCC or VSS. The value of these pins are returned by executing READ ID command during adapter setup operation.																																				
12-15	B	A23-20 /AO3-0	Mode 0: A23-20 Address Input. These bits are used for the address decoding of the memory slave device. Mode 1: AO3-0 Latched Address Output. These bits are latched by ADL and are used by the peripheral device to address the registers.																																				
16-17	I	A19-18 /MASK3-2	Mode 0: A19-16 Address Input. They are used for the address decoding of the memory slave device.																																				
19-20	I	A17-16 /MASK1-0	Mode 1: MASK3-0. Active low mask bits for the comparator of the resource relocator. When the mask bit is on (low), the comparison of the corresponding address input (A3-0) with the card address bits (ADR3-0) is bypassed.																																				
21-34 36-37	I	A15-2 A1-0	System Address bits 15 to 0. These bits are used for the address decoding of the slave IO or memory device. They are also used to address the POS registers.																																				
38 39	I	<u>S0</u> S1	Status bits 0 and 1. These signals indicate the start and the type of channel cycle. It is used with M/IO to generate the memory or IO read and write commands.																																				
			<table> <thead> <tr> <th>M/<u>IO</u></th> <th><u>S0</u></th> <th><u>S1</u></th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>Reserved</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>IO Write</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>IO Read</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>Reserved</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>Reserved</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>Memory Write</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>Memory Read</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>Reserved</td> </tr> </tbody> </table>	M/ <u>IO</u>	<u>S0</u>	<u>S1</u>	Function	0	0	0	Reserved	0	0	1	IO Write	0	1	0	IO Read	0	1	1	Reserved	1	0	0	Reserved	1	0	1	Memory Write	1	1	0	Memory Read	1	1	1	Reserved
M/ <u>IO</u>	<u>S0</u>	<u>S1</u>	Function																																				
0	0	0	Reserved																																				
0	0	1	IO Write																																				
0	1	0	IO Read																																				
0	1	1	Reserved																																				
1	0	0	Reserved																																				
1	0	1	Memory Write																																				
1	1	0	Memory Read																																				
1	1	1	Reserved																																				
40	I	M/ <u>IO</u>	Memory/Input Output. When M/ <u>IO</u> is high, it indicates a memory cycle. If it is low, it indicates an IO cycle.																																				
41	I	<u>CMD</u>	Active low Command signal to define when data is valid on the data bus. It is used to generate the IO/memory read and write commands and is also used to latch the status signals.																																				

82C574 Pin Description (Continued)

Pin No.	Pin Type	Symbol	Description
10	I	CDSETUP	Active low Card Setup enable signal. During configuration and error recovery procedures, CDSETUP becomes active along with IO Read/Write commands to access the POS registers.
11	I	MADE24 /ADL	Mode 0: MADE24. Active low Memory Address Enable 24. It goes active when a memory cycle is in progress with the memory address less than 16 M. It is used in the memory address decoding. Mode 1: ADL. Active low Address Decode Latch. It is used to latch the A0-3 address lines.
42	O	CDSFBK	Active low Card Select Feedback. This signal goes active when a memory or IO slave device is addressed by the host. It stays inactive during setup cycle.
43	O	CDCHRDY	Card Channel Ready. This signal is used by the slow IO or memory slave device to extend the channel cycle. During setup operation, CDCHRDY always stays active and no bus cycle is extended. The maximum time CDCHRDY can stay inactive is 3 μ s.
60	I	RDYIN	Active high Ready Input from IO or memory slave device. For asynchronous extended channel cycle operation, CDCHRDY goes inactive at the beginning of the cycle and stays inactive until a low to high transition is detected on RDYIN pin.
44-51	B	D0-7	System data bit 0 to 7. These bits are used to transfer the data to and from the CPU data bus during the configuration cycle. They are 3 state bidirectional lines.
53	O	BCTL	Active low external 74LS245 buffer transfer direction control signal. It becomes active during IO/memory READ operation if POS registers or external IO/memory slave device is addressed.
54	O	BCS	Active low 74LS245 buffer chip enable. It goes active if internal POS registers or external IO/memory slave device is addressed. (Either read or write operation.)
55	I	RESET	Active high hardware reset signal to initialize the chip. It should stay high for a minimum period of 500 ns.
56	O	IORD	Active low IO read strobe. It is the decoded command from CPU to read the device registers. It goes active only when the external IO slave is addressed.

82C574 Pin Description (Continued)

Pin No.	Pin Type	Symbol	Description
57	O	<u>IOWR</u>	Active low IO write strobe. It is the decoded command from CPU to load the information into the registers of the external addressed IO slave device.
59	O	<u>MEMWR /IRQSL1</u>	Mode 0: MEMWR. Active low memory write strobe. When active, the 82C570 display buffer is written or the external microcode is downloaded. Mode 1: IRQSL1. It is the content of bit 2 of POS register 102H and is used to select the interrupt level.
58	O	<u>MEMRD /IRQSL0</u>	Mode 0: MEMRD. Active low memory read strobe. When active, the 82C570 display buffer is read. Mode 1: IRQSL0. This pin is the content of bit 1 of POS register 102H and is used with IRQSL1 for the interrupt level selection.
18, 52	I	VCC	5V Power supply.
1, 35	I	VSS	Power Supply Ground.

Note:

I = Input
 O = Output
 B = Bidirectional

82C574 Functional Description

The 82C574 block diagram is illustrated in Fig 1. The chip consists of the following functional blocks:

- POS Registers
- Peripheral Commands and Card Select Feedback Generator
- Resource Relocation Logic
- Card Channel Ready Signal Generator

POS REGISTERS

A total of 6 POS registers are supported by 82C574. These registers can be accessed only during configuration cycle by activating CDSETUP, M/IO to low. The description of each register are as follows:

1.100H: Low Byte ID Register.

Bit	7	6	5	4	3	2	1	0
	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0

This register is read only. The reading of this register returns the content of pins ID7-ID0.

2.101H: High Byte ID Register.

Bit	7	6	5	4	3	2	1	0
	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8

Read only register. The content of pins ID15-ID8 is returned when reading this register.

3.102H: Miscellaneous Register.

Bit	7	6	5	4	3	2	1	0
	X	X	X	X	RDYCTL	IRQSL1	IRQSL0	CDEN

Bits 7-4 are unused. The reading of these bits are "1". Bit 3 RDYCTL is used in **mode 1** to control the CDCHRDY signal generation. A "0" selects the synchronous extended channel cycle. A "1" selects the asynchronous extended cycle.

Bit 2-1 IRQSL1 and IRQSL0. They are used in **mode 1** with the external 72LS156 demultiplexer to select the interrupt level.

Bit 0 Card Enable control bit. When this bit is "0", the adapter is disabled. 82C574 responds only to setup IO read and write operations. It does not respond to the access of peripheral IO registers or memory.

Register 102H is readable and writable. All the bits are reset to "0" by RESET signal.

4.103H: Low Byte Card Address Register.

Bit	7	6	5	4	3	2	1	0
	ADR15	ADR14	ADR13	ADR12				

5.104H: High Byte Card Address Register.

Bit	7	6	5	4
	ADR15	ADR14	ADR13	ADR12

Bit	3	2	1	0
	ADR11	ADR10	ADR9	ADR8

The Card Address registers are read/write registers. They are used for resource relocation to avoid the adapter conflict. In case of the same adapter address, the host can reassign the board address. These two registers are used in **mode 1** operation. To generate the IO read/write commands for the peripheral or to activate the CDSFBK or inactivate the CDCHRDY signals, the address from host A15 to A4 have to match ADR15 to ADR4, A3 to A0 may bypass the comparison with ADR3 to ADR0 if the individual mask bit is activated by forcing MASK3-0 pins to VSS. ADR15 is the most significant bit (MSB) and ADR0 is the least significant bit (LSB).

6.105H: Mode Select Register.

Bit	7	6	5	4	3	2	1	0
	X	X	X	X	MODSL3	MODSL2	MODSL1	MODSL0

Bits 4-7 are unused. The reading of these bits are "1". Bits 3-0 are used to select operation modes. Pattern 1010 is for **mode 1**: General Purpose 8 Bit I/O Slave Peripheral application. All other combinations of bit pattern are for **mode 0** operation: 82C570 CHIPSLINK application. RESET signal resets all the bits to "0" which is **mode 0** operation.

Register 105H is a read/write register.

PERIPHERAL COMMANDS AND CARD SELECT FEEDBACK GENERATOR

The peripheral read/write command is generated by decoding the IO or memory address, M/IO, S0, S1 status and gating with CMD signal.

Mode 0:

In this mode, both IO and memory operations are supported. For IO operation, the decoding of IO address 02DXH or 022XH will activate the IORD if S0 = 1 and S1 = 0 or IOWR if S0 = 0 and S1 = 1. For memory operation, the decoding of memory space of 0CE000 to 0CFFFF will generate MEMRD or MEMWR commands.

Mode 1:

The IO operation is supported in this mode. To generate the IO read/write commands, the address from host needs to match the relocation card address programmed in POS registers. (A0-A3 comparison can be bypassed by activating MASK3 to MASK0 individually.)

The Card Select Feedback (CDSFBK) is used to inform the host that the adapter is selected. It stays inactive during setup cycle. It is generated by decoding the IO address space and S0, S1 status. It should go active within 50 ns after Address, M/IO, MADE24 become valid and within 25 ns from the time status becomes active.

RESOURCE RELOCATION LOGIC

The resource relocation capability is supported in **mode 1**. The operation of this block was described in the POS REGISTERS section.

CARD CHANNEL READY GENERATOR

The basic channel cycle time in IBM PS/2 system is 200 ns. It can be extended by using CDCHRDY signal. There are two ways to extend the cycle: Synchronously or Asynchronously.

Mode 0:

When the host addresses the IO space of 02DXH or 022XH, the CDCHRDY will go low within 55 ns from the time M/IO, Address become valid (25 ns from the time status S0, S1 becomes valid) and then return to high within 25 ns after CMD becomes active. The bus cycle is extended from 200 ns to 300 ns, this is called synchronously extended.

If the host accesses the memory space of 0CE000 to 0CFFFF, CDCHRDY will go inactive just like IO access but it will stay low until a low to high transition on pin RDYIN is detected. This is called asynchronously extended bus cycle.

Mode 1:

The bus extention can be done in either way by programming the RDYCTL bit in POS register. If this bit is "0", the bus cycle is extended synchronously to 300 ns. A "1" in this bit will extend the cycle asynchronously.

APPLICATION

Figure 2 shows the application diagram for 82C570 CHIPSLINK 3270 protocol controller. The Card ID is selected by tying ID0 to ID15 pins to VCC or VSS. This provides a flexible choice. RDYIN from 82C570 is used to control the bus cycle for dual port RAM access. D0-7 are used during setup cycle. The 82C574 also provides the 74LS245 buffer chip select and direction control signals. Due to the high integration of both 82C574 and 82C570, only

a few components are required to implement the solution for micro to mainframe communication in microchannel environment.

Figure 3 shows the application diagram for the 8 bit IO slave peripherals. In this mode, the resource relocation capability is provided. The interrupt level can be selected by software during setup cycle. The address 0 to 3 are also latched by the 82C574 for the peripherals.

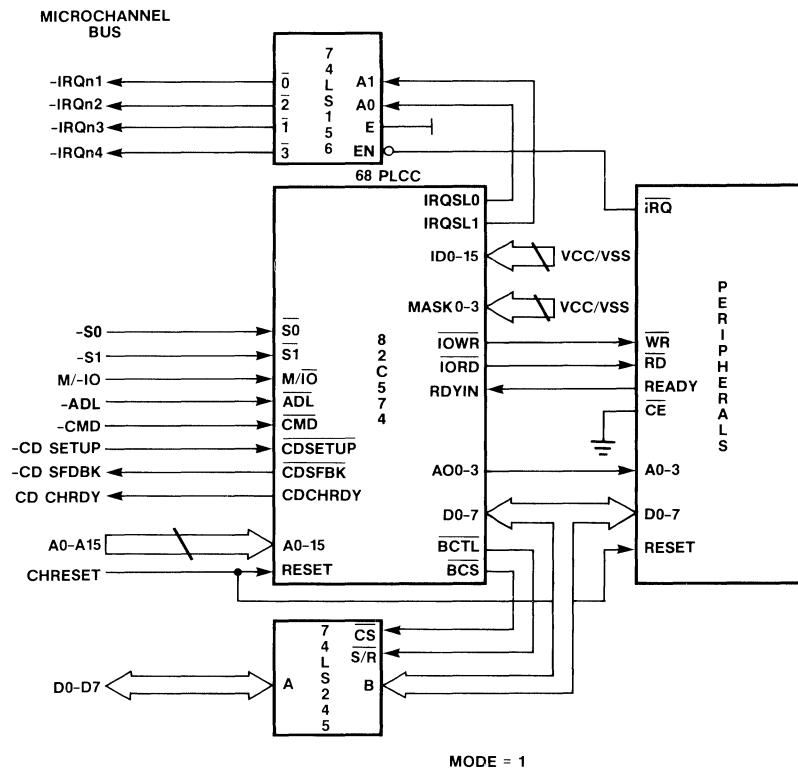

Figure 3. 82C574 Application Diagram for 8 Bit I/O Slave Peripherals

Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Units
Supply Voltage	V _{CC}	—	7.0	V
Input Voltage	V _I	-0.5	5.5	V
Output Voltage	V _O	-0.5	5.5	V
Operating Temperature	T _{OP}	-25	85	°C
Storage Temperature	T _{STG}	-40	125	°C

NOTE: Permanent device damage may occur if Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions described under Operating Conditions.

82C574 Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Supply Voltage	V _{CC}	4.75	5.25	V
Ambient Temperature	T _A	0	70	°C

82C574 DC Characteristics

Parameter	Symbol	Min.	Max.	Units
Power Supply Current	I _{CC}	—	30	mA
Input Low Voltage	V _{IL}	-0.5	0.8	V
Input High Voltage	V _{IH}	2.0	V _{CC} +0.5	V
Output Low Voltage (Note 1)	V _{OL}	—	0.4	V
Output High Voltage (Note 1)	V _{OH}	2.4	—	V
Input Leakage Current For V _{IN} = 0 to V _{CC}	I _{IL}	-10	10	μA
Output Tri-State Leakage Current For V _O = 0 to V _{CC}	I _{IL}	-10	10	μA

Note 1: I_{OL} = 6 mA I_{OH} = -2 mA for pins CDCHRDY, CDSFBK.
I_{OL} = 2.4 mA I_{OH} = -400 μA for all other pins.

Capacitance ($T_A = 25^\circ\text{C}$, $V_{CC} = 0$)

Parameter	Symbol	Min.	Max.	Units
Input Capacitance For $F_C = 1 \text{ MHz}$	C_{IN}	—	10	pF
Output Capacitance	C_{OUT}	—	20	pF
I/O Capacitance	$C_{I/O}$	—	20	pF

82C574 AC Characteristics

($T_A = 0^\circ\text{C}$ to 70°C , $V_{CC} = 5V \pm 5\%$, $CL = 60 \text{ pF}$ for all the output pins)

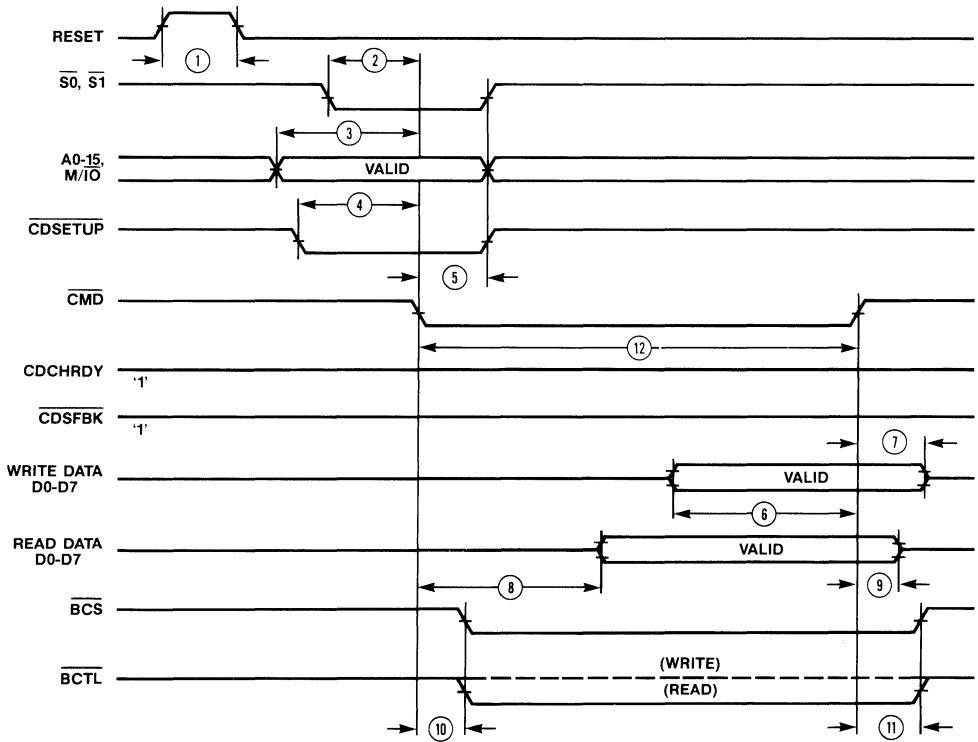

Sym	Description	Min.	Typ.	Max.	Units
t1	RESET Active Pulse Width	500			ns
