

- High-Performance Floating-Point Digital Signal Processor (DSP)
  - TMX320C30-50  
40-ns Instruction Cycle Time  
275 MOPS, 50 MFLOPS, 25 MIPS
  - TMS320C30-40  
50-ns Instruction Cycle Time  
220 MOPS, 40 MFLOPS, 20 MIPS
  - TMS320C30-33  
60-ns Instruction Cycle Time  
183.3 MOPS, 33.3 MFLOPS, 16.7 MIPS
  - TMS320C30-27  
74-ns Instruction Cycle Time  
148.5 MOPS, 27 MFLOPS, 13.5 MIPS
- 32-Bit High-Performance CPU
- 16-/32-Bit Integer and 32-/40-Bit Floating-Point Operations
- 32-Bit Instruction Word, 24-Bit Addresses
- Two  $1K \times 32$ -Bit Single-Cycle Dual-Access On-Chip RAM Blocks
- One  $4K \times 32$ -Bit Single-Cycle Dual-Access On-Chip ROM Block
- On-Chip Memory-Mapped Peripherals:
  - Two Serial Ports
  - Two 32-Bit Timers
  - One-Channel Direct Memory Access (DMA) Coprocessor for Concurrent I/O and CPU Operation
- Two 32-Bit External Ports
- 24- and 13-Bit Addresses
- 0.7- $\mu$ m Enhanced Performance Implanted CMOS (EPIC™) Technology
- 208-Pin Plastic Quad Flat Package (PPM Suffix)
- 181-Pin Grid Array Ceramic Package (GEL Suffix)
- Eight Extended-Precision Registers
- Two Address Generators With Eight Auxiliary Registers and Two Auxiliary Register Arithmetic Units (ARAUs)
- Two- and Three-Operand Instructions
- Parallel Arithmetic and Logic Unit (ALU) and Multiplier Execution in a Single Cycle
- Block-Repeat Capability
- Zero-Overhead Loops With Single-Cycle Branches
- Conditional Calls and Returns
- Interlocked Instructions for Multiprocessing Support
- Two Sets of Memory Strobes (STRB and MSTRB) and One I/O Strobe (IOSTRB)
- Separate Bus-Control Registers for Each Strobe-Control Wait-State Generation

### **description**

The TMS320C30 is the newest member of the TMS320C3x generation of DSPs from Texas Instruments (TI™). The TMS320C30 is a 32-bit floating-point processor manufactured in 0.7- $\mu$ m triple-level-metal CMOS technology.

The TMS320C30's internal busing and special DSP instruction set have the speed and flexibility to execute up to 50 MFLOPS (million floating-point operations per second). The TMS320C30 optimizes speed by implementing functions in hardware that other processors implement through software or microcode. This hardware-intensive approach provides performance previously unavailable on a single chip.

The TMS320C30 can perform parallel multiply and ALU operations on integer or floating-point data in a single cycle. Each processor also possesses a general-purpose register file, a program cache, dedicated ARAUs, internal dual-access memories, one DMA channel supporting concurrent I/O, and a short machine-cycle time. High performance and ease of use are results of these features.

General-purpose applications are enhanced greatly by the large address space, multiprocessor interface, internally and externally generated wait states, two external interface ports, two timers, serial ports, and multiple interrupt structure. The TMS320C30 supports a wide variety of system applications from host processor to dedicated coprocessor.

High-level language support is implemented easily through a register-based architecture, large address space, powerful addressing modes, flexible instruction set, and well-supported floating-point arithmetic.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

EPIC and TI are trademarks of Texas Instruments Incorporated.

UNLESS OTHERWISE NOTED this document contains PRODUCTION DATA information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## pinout and pin assignments

### TMS320C30 GEL pinout and pin assignments

The TMS320C30 digital signal processor is available in a 181-pin grid array (PGA) package. The pinout of this package is shown in the following two illustrations. The pin assignments are listed in the TMS320C30 GEL pin assignments (alphabetical) table and the TMS320C30 GEL pin assignments (numerical) table.

## TMS320C30 PPM pinout and pin assignments

The TMS320C30 PPM device is packaged in a 208-pin plastic quad flatpack (PQFP) JEDEC standard package. The following illustration shows the pinout for this package. The pin assignments are listed in the TMS320C30 PPM pin assignments (alphabetical) table and the TMS320C30 PPM pin assignments (numerical) table.

## pin functions

This section provides signal descriptions for the TMS320C30 in the microprocessor mode. The following tables list each signal, the number of pins, type of operating mode(s) (that is, input, output, or high-impedance state as indicated by I, O, or Z), and a brief description of its function. All pins labeled NC have special functions and should not be connected by the user. A line over a signal name (for example, RESET) indicates that the signal is active low (true at logic 0 level). The signals are grouped according to function.

### TMS320C30 Pin Functions

PIN NAME	QTY#	TYPE†	DESCRIPTION	CONDITIONS WHEN SIGNAL IS Z TYPE§
<b>PRIMARY BUS INTERFACE</b>				
D31–D0	32	I/O/Z	32-bit data port of the primary bus interface	S H R
A23–A0	24	O/Z	24-bit address port of the primary bus interface	S H R
R/ <u>W</u>	1	O/Z	Read/write for primary bus interface. R/ <u>W</u> is high when a read is performed and low when a write is performed over the parallel interface.	S H R
STRB	1	O/Z	External access strobe for the primary bus interface	S H
<u>RDY</u>	1	I	Ready. <u>RDY</u> indicates that the external device is prepared for a primary-bus-interface transaction to complete.	
<u>HOLD</u>	1	I	Hold for primary bus interface. When <u>HOLD</u> is a logic low, any ongoing transaction is completed. A23–A0, D31–D0, STRB, and R/ <u>W</u> are in the high-impedance state and all transactions over the primary bus interface are held until HOLD becomes a logic high or the NOHOLD bit of the primary-bus-control register is set.	
HOLDA	1	O/Z	Hold acknowledge for primary bus interface. HOLDA is generated in response to a logic low on HOLD. HOLDA indicates that A23–A0, D31–D0, STRB, and R/ <u>W</u> are in the high-impedance state and that all transactions over the bus are held. HOLDA is high in response to a logic high of HOLD or when the NOHOLD bit of the primary-bus-control register is set.	S
<b>EXPANSION BUS INTERFACE</b>				
XD31–XD0	32	I/O/Z	32-bit data port of the expansion bus interface	S R
XA12–XA0	13	O/Z	13-bit address port of the expansion bus interface	S R
XR/ <u>W</u>	1	O/Z	Read/write signal for expansion bus interface. When a read is performed, XR/ <u>W</u> is held high; when a write is performed, XR/ <u>W</u> is low.	S R
MSTRB	1	O/Z	External memory access strobe for the expansion bus interface	S
IOSTRB	1	O/Z	External I/O access strobe for the expansion bus interface	S
<u>XRDY</u>	1	I	Ready signal. <u>XRDY</u> indicates that the external device is prepared for an expansion-bus-interface transaction to complete.	
<b>CONTROL SIGNALS</b>				
RESET	1	I	Reset. When <u>RESET</u> is a logic low, the device is in the reset condition. When <u>RESET</u> becomes a logic high, execution begins from the location specified by the reset vector.	
INT3–INT0	4	I	External interrupts	
<u>IACK</u>	1	O/Z	Interrupt acknowledge. <u>IACK</u> is set to a logic high by the IACK instruction. IACK can be used to indicate the beginning or end of an interrupt-service routine.	S
MC/ <u>MP</u>	1	I	Microcomputer/microprocessor mode	
XF1, XF0	2	I/O/Z	External flags. XF1 and XF0 are used as general-purpose I/Os or to support interlocked processor instructions.	S R

† I = input, O = output, Z = high-impedance state. All pins labeled NC have specified functions and should not be connected by the user.

‡ Quantity is the same for GEL and PPM packages unless otherwise noted.

§ S = SHZ active, H = HOLD active, R = RESET active

PIN NAME	QTY†	TYPE†	DESCRIPTION	CONDITIONS WHEN SIGNAL IS Z TYPE§
<b>SERIAL PORT 0 SIGNALS</b>				
CLKX0	1	I/O/Z	Serial port 0 transmit clock. CLKX0 is the serial shift clock for the serial port 0 transmitter.	S R
DX0	1	I/O/Z	Data transmit output. Serial port 0 transmits serial data on DX0.	S R
FSX0	1	I/O/Z	Frame synchronization pulse for transmit. The FSX0 pulse initiates the transmit data process over DX0.	S R
CLKR0	1	I/O/Z	Serial port 0 receive clock. CLKR0 is the serial shift clock for the serial port 0 receiver.	S R
DR0	1	I/O/Z	Data receive. Serial port 0 receives serial data on DR0.	S R
FSR0	1	I/O/Z	Frame synchronization pulse for receive. The FSR0 pulse initiates the receive data process over DR0.	S R
<b>SERIAL PORT 1 SIGNALS</b>				
CLKX1	1	I/O/Z	Serial port 1 transmit clock. CLKX1 is the serial shift clock for the serial port 1 transmitter.	S R
DX1	1	I/O/Z	Data transmit output. Serial port 1 transmits serial data on DX1.	S R
FSX1	1	I/O/Z	Frame synchronization pulse for transmit. The FSX1 pulse initiates the transmit data process over DX1.	S R
CLKR1	1	I/O/Z	Serial port 1 receive clock. CLKR1 is the serial shift clock for the serial port 1 receiver.	S R
DR1	1	I/O/Z	Data receive. Serial port 1 receives serial data on DR1.	S R
FSR1	1	I/O/Z	Frame synchronization pulse for receive. The FSR1 pulse initiates the receive data process over DR1.	S R
<b>TIMER 0 SIGNAL</b>				
TCLK0	1	I/O/Z	Timer clock 0. As an input, TCLK0 is used by timer 0 to count external pulses. As an output, TCLK0 outputs pulses generated by timer 0.	S R
<b>TIMER 1 SIGNAL</b>				
TCLK1	1	I/O/Z	Timer clock 1. As an input, TCLK1 is used by timer 1 to count external pulses. As an output, TCLK1 outputs pulses generated by timer 1.	S R
<b>SUPPLY AND OSCILLATOR SIGNALS</b>

MDV <sub>DD</sub>	1	2	I	5 V supply¶
V <sub>SS</sub>	4	8	I	Ground
DV <sub>SS</sub>	4	8	I	Ground
CV <sub>SS</sub>	2	4	I	Ground
IV <sub>SS</sub>	2	1	I	Ground

† I = input, O = output, Z = high-impedance state. All pins labeled NC have special functions and should not be connected by the user.

‡ Quantity is the same for GEL and PPM packages unless otherwise noted.

§ S = SHZ active, H = HOLD active, R = RESET active

¶ Recommended decoupling capacitor is 0.1 µF.

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

**TMS320C30 Pin Functions (Continued)**

PIN NAME	QTY‡	TYPE†	DESCRIPTION	CONDITIONS WHEN SIGNAL IS Z TYPE§
<b>SUPPLY AND OSCILLATOR SIGNALS (CONTINUED)</b>				
V <sub>BBP</sub>	1	NC	V <sub>BB</sub> pump oscillator output	
V <sub>SUBS</sub>	1	I	Substrate terminal. Tie to ground.	
X1	1	O	Output from the internal oscillator for the crystal. If a crystal is not used, X1 should be left unconnected.	
X2/CLKIN	1	I	Input to the internal oscillator from the crystal or a clock	
H1	1	O/Z	External H1 clock. H1 has a period equal to twice CLKIN.	S
H3	1	O/Z	External H3 clock. H3 has a period equal to twice CLKIN.	S
<b>RESERVED¶</b>				
EMU0–EMU2	3	I	Reserved. Use pullup resistors to 5 V.	
EMU3	1	O/Z	Reserved	S
EMU4/ <u>SHZ</u>	1	I	Shutdown high impedance. When active, EMU4/ <u>SHZ</u> shuts down the TMS320C30 and places all pins in the high-impedance state. EMU4/ <u>SHZ</u> is used for board-level testing to ensure that no dual-drive conditions occur. <b>CAUTION:</b> A low on <u>SHZ</u> corrupts TMS320C30 memory and register contents. Reset the device with <u>SHZ</u> high to restore it to a known operating condition.	
EMU5, EMU6	2	NC	Reserved	
RSV10–RSV5	6	I/O	Reserved. Use pullup resistors to 5 V.	
RSV4–RSV0	5	I	Reserved. Tie pins directly to 5 V.	
Locator	1#	NC	Reserved	

† I = input, O = output, Z = high-impedance state. All pins labeled NC have special functions and should not be connected by the user.

‡ Quantity is the same for GEL and PPM packages unless otherwise noted.

§ S = SHZ active, H = HOLD active, R = RESET active

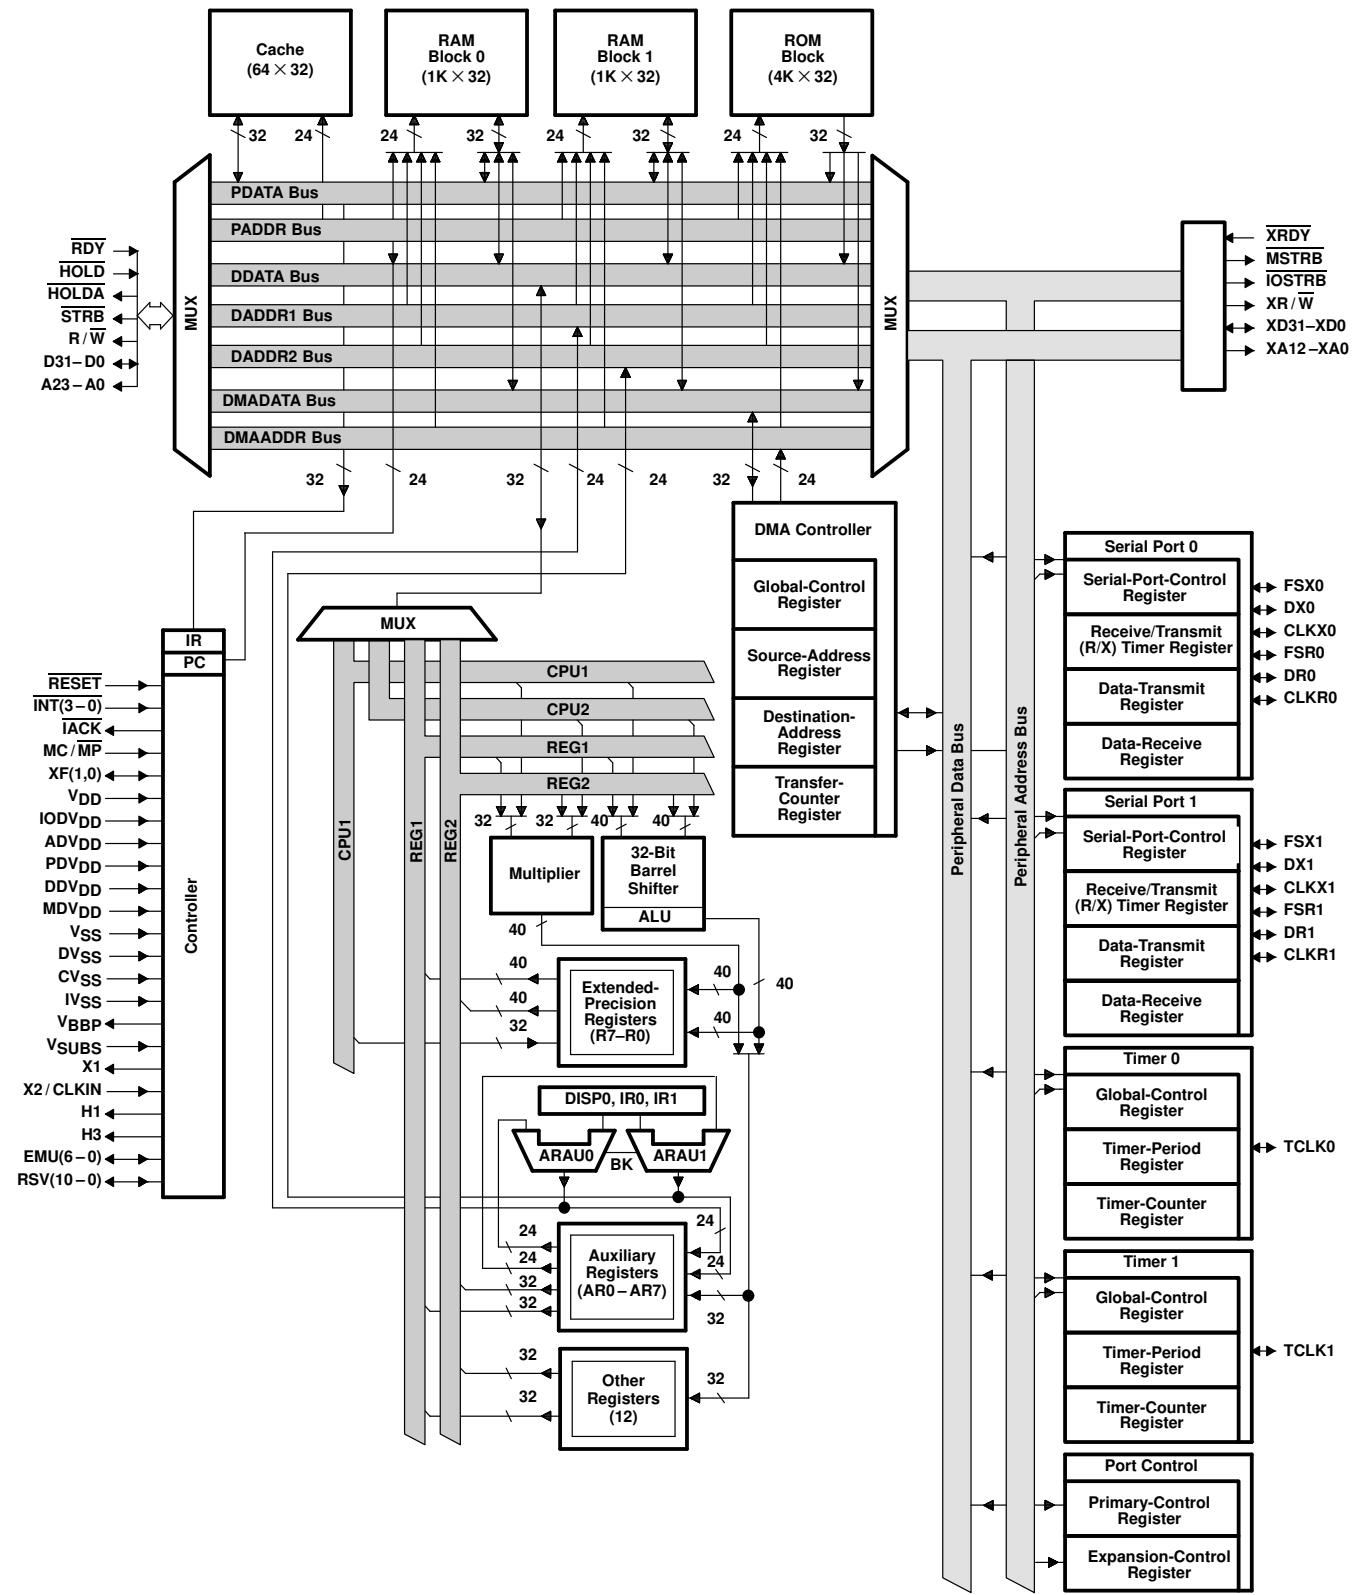

¶ Follow the connections specified for the reserved pins. Use 18-kΩ–22-kΩ pullup resistors for best results. All 5-V supply pins must be connected to a common supply plane, and all ground pins must be connected to a common ground plane.

# For the GEL package only. There is no locator in the PPM package.

## absolute maximum ratings over specified temperature range (unless otherwise noted)<sup>†</sup>

Supply voltage range, $V_{CC}$ (see Note 1)	.....	–0.3 V to 7 V
Input voltage range, $V_I$	.....	–0.3 V to 7 V
Output voltage range, $V_O$	.....	–0.3 V to 7 V
Continuous power dissipation (see Note 2)	.....	3.15 W
Operating case temperature range, $T_C$	.....	0°C to 85°C
Storage temperature range, $T_{stg}$	.....	–55°C to 150°C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. All voltage values are with respect to  $V_{SS}$ .

- Actual operating power is less. This value is obtained under specially produced worst-case test conditions, which are not sustained during normal device operation. These conditions consist of continuous parallel writes of a checkerboard pattern to both primary and extension buses at the maximum rate possible. See normal ( $I_{CC}$ ) current specification in the electrical characteristics table and also read *Calculation of TMS320C30 Power Dissipation Application Report* (literature number SPRA020).

## recommended operating conditions (see Note 3)

		MIN	NOM <sup>‡</sup>	MAX	UNIT
$V_{DD}$	Supply voltage ( $AV_{DD}$ , etc.)	4.75	5	5.25	V
$V_{SS}$	Supply voltage ( $CV_{SS}$ , etc.)	.....	0	.....	V
$V_{IH}$	High-level input voltage	All other pins	2	$V_{DD} + 0.3\$$	V
		CLKIN	2.6	$V_{DD} + 0.3\$$	
$V_{IL}$	Low-level input voltage	.....	–0.3\$	0.8	V
$I_{OH}$	High-level output current	.....	.....	–300	$\mu A$
$I_{OL}$	Low-level output current	.....	.....	2	mA
$T_C$	Operating case temperature	0	.....	85	$^{\circ}C$

<sup>‡</sup> All nominal values are at  $V_{DD} = 5$  V,  $T_A$  (ambient air temperature)= 25°C.

<sup>\$</sup> These values are derived from characterization and not tested.

NOTE 3: All input and output voltage levels are TTL-compatible.

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

**electrical characteristics over recommended ranges of supply voltage (unless otherwise noted)  
(see Note 3)†**

PARAMETER		TEST CONDITIONS‡	MIN	TYP§	MAX	UNIT
V <sub>OH</sub>	High-level output voltage	V <sub>DD</sub> = MIN, I <sub>OH</sub> = MAX	2.4	3		V
V <sub>OL</sub>	Low-level output voltage	V <sub>DD</sub> = MIN, I <sub>OL</sub> = MAX		0.3	0.6¶	V
I <sub>Z</sub>	High-impedance current	V <sub>DD</sub> = MAX	-20		20	µA
I <sub>I</sub>	Input current	V <sub>I</sub> = V <sub>SS</sub> to V <sub>DD</sub>	-10		10	µA
I <sub>IP</sub>	Input current	Inputs with internal pullups (see Note 4)	-400		20	µA
I <sub>CC</sub>	Supply current	TA = 25°C, V <sub>DD</sub> = MAX, t <sub>c(Cl)</sub> = MIN, See Note 5	'320C30-27	130	600	mA
			'320C30-33	150	600	
			'320C30-40	175	600

C <sub>i</sub>	CLKIN			25		pF
	All other inputs			15		
C <sub>o</sub>	Output capacitance			20#		pF

† All data for the '320C30-50 is advance information.

‡ For conditions shown as MIN/MAX, use the appropriate value specified in recommended operating conditions.

§ All typical values are at V<sub>DD</sub> = 5 V, TA (ambient air temperature) = 25°C.

¶ These values are derived from characterization but not tested.

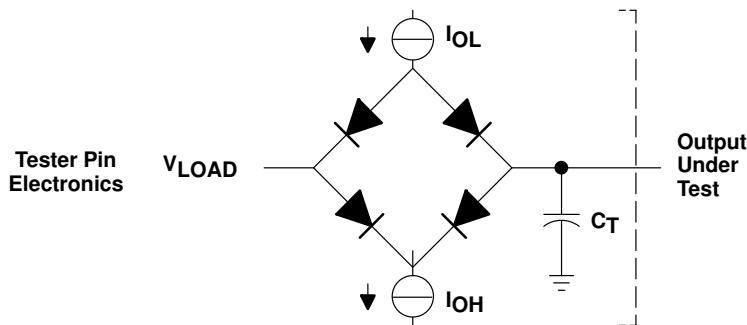

# These values are derived by design but not tested.

- NOTES:
- 3. All input and output voltage levels are TTL-compatible.
  - 4. Pins with internal pullup devices: INT0–INT3, MC/MP, RSV0–RSV10. Although RSV0–RSV10 have internal pullup devices, external pullups should be used on each pin as identified in the pin functions tables.
  - 5. Actual operating current is less than this maximum value. This value is obtained under specially produced worst-case test conditions, which are not sustained during normal device operation. These conditions consist of continuous parallel writes of a checkerboard pattern to both primary and expansion buses at the maximum rate possible. See *Calculation of TMS320C30 Power Dissipation Application Report* (literature number SPRA020).

## PARAMETER MEASUREMENT INFORMATION

Where:  
 $I_{OL}$  = 2 mA (all outputs)  
 $I_{OH}$  = 300  $\mu$ A (all outputs)  
 $V_{LOAD}$  = 2.15 V  
 $C_T$  = 80-pF typical load-circuit capacitance

Figure 2. Test Load Circuit

### signal transition levels

TTL-level outputs are driven to a minimum logic-high level of 2.4 V and to a maximum logic-low level of 0.6 V. Output transition times are specified as follows (see Figure 3):

- For a high-to-low transition on a TTL-compatible output signal, the level at which the output is said to be no longer high is 2 V and the level at which the output is said to be low is 1 V.
- For a low-to-high transition, the level at which the output is said to be no longer low is 1 V and the level at which the output is said to be high is 2 V.

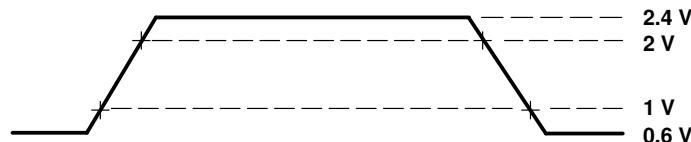

Figure 3. TTL-Level Outputs

Transition times for TTL-compatible inputs are specified as follows (see Figure 4):

- For a high-to-low transition on an input signal, the level at which the input is said to be no longer high is 2 V and the level at which the input is said to be low is 0.8 V.
- For a low-to-high transition on an input signal, the level at which the input is said to be no longer low is 0.8 V and the level at which the input is said to be high is 2 V.

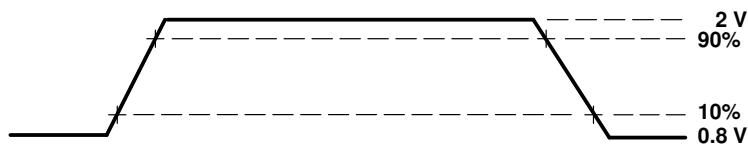

Figure 4. TTL-Level Inputs

## PARAMETER MEASUREMENT INFORMATION

### timing parameter symbology

Timing parameter symbols used herein were created in accordance with JEDEC Standard 100-A. In order to shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows, unless otherwise noted:

A	(L)A30–(L)A0 or (L)Ax	IOS	<u>IOSTRB</u>
ASYNCH	Asynchronous reset signals in the high-impedance state	(M)S	<u>(M)STRB</u> , includes <u>STRB</u> and <u>MSTRB</u>
CH	CLKX0 and CLKX1	RDY	<u>RDY</u>
CI	CLKIN	RESET	<u>RESET</u>
CLKR	CLKR0 and CLKR1	RW	<u>R/W</u>
CONTROL	Control signals	S	<u>(M)S</u> , which includes <u>MSTRB</u> , <u>STRB</u> ; and IOS, <u>IOSTRB</u>
D	D31–D0 or Dx	SCK	CLKX/R, includes CLKX0, CLKX1, CLKR0, and CLKR1
DR	DR0 and DR1	TCLK	TCLK0 and TCLK1
DX	DX0 and DX1	XA	XA12–XA0 or XAx
FS	FSX/R, includes FSX0, FSX1, FSR0, and FSR1	(X)A	Includes A23–A0 and XA12–XA0
FSR	FSR0 and RSR1	XD	XD31–XD0 or XDx
FSX	FSX0 and FSX1	(X)D	Includes D31–D0 and XD31–XD0
GPIO	General-purpose input/output (peripheral pins include CLKX0/1, CLKR0/1, DX0/1, DR0/1, FSX0/1, FSR0/1, TCLK0/1)	XF	XFx, includes XF0 and XF1
H	H1 and H3	XF0	XF0
H1	H1	XF1	XF1
H3	H3	XFIO	XFx switching from input to output
HOLD	<u>HOLD</u>	XRDY	<u>XRDY</u>
HOLDA	<u>HOLDA</u>	(X)RDY	<u>(X)RDY</u> , includes <u>RDY</u> and <u>XRDY</u>

## X2/CLKIN, H1, and H3 timing

The following table defines the timing parameters for the X2/CLKIN, H1, and H3 interface signals. The numbers shown in Figure 5 and Figure 6 correspond with those in the NO. column of the table below. Refer to the RESET timing in Figure 17 for CLKIN to H1 and H3 delay specification.

### timing parameters for X2/CLKIN, H1, H3 (see Figure 5 and Figure 6)

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_f(Cl)$	Fall time, CLKIN		6†		5†		5†		5† ns
2	$t_w(CIL)$	Pulse duration, CLKIN low $t_c(Cl) = \text{min}$		14		10		9		7 ns
3	$t_w(CIH)$	Pulse duration, CLKIN high $t_c(Cl) = \text{min}$		14		10		9		7 ns
4	$t_r(Cl)$	Rise time, CLKIN		6†		5†		5†		5† ns
5	$t_c(Cl)$	Cycle time, CLKIN	37	303	30	303	25	303	20	303 ns
6	$t_f(H)$	Fall time, H1 and H3		4		3		3		3 ns
7	$t_w(HL)$	Pulse duration, H1 and H3 low	P-6‡		P-6‡		P-5‡		P-5‡	ns
8	$t_w(HH)$	Pulse duration, H1 and H3 high	P-7‡		P-7‡		P-6‡		P-6‡	ns
9	$t_r(H)$	Rise time, H1 and H3		5		4		3		3 ns
9.1	$t_d(HL-HH)$	Delay time, from H1 low to H3 high or from H3 low to H1 high	0	6	0	5	0	4	0	4 ns
10	$t_c(H)$	Cycle time, H1 and H3	74	606	60	606	50	606	40	606 ns

† Specified by design but not tested

## XF0 and XF1 timing when executing LDFI or LDII

The following table defines the timing parameters for XF0 and XF1 during execution of LDFI or LDII. The numbers shown in Figure 11 correspond with those in the NO. column of the table below.

### timing parameters for XF0 and XF1 when executing LDFI or LDII (see Figure 11)

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_d(H3H-XF0L)$	Delay time, H3 high to XF0 low		19		15		13	12	ns
2	$t_{su}(XF1-H1L)$	Setup time, XF1 before H1 low		13		10		9	9	ns
3	$t_h(H1L-XF1)$	Hold time, XF1 after H1 low		0		0		0	0	ns

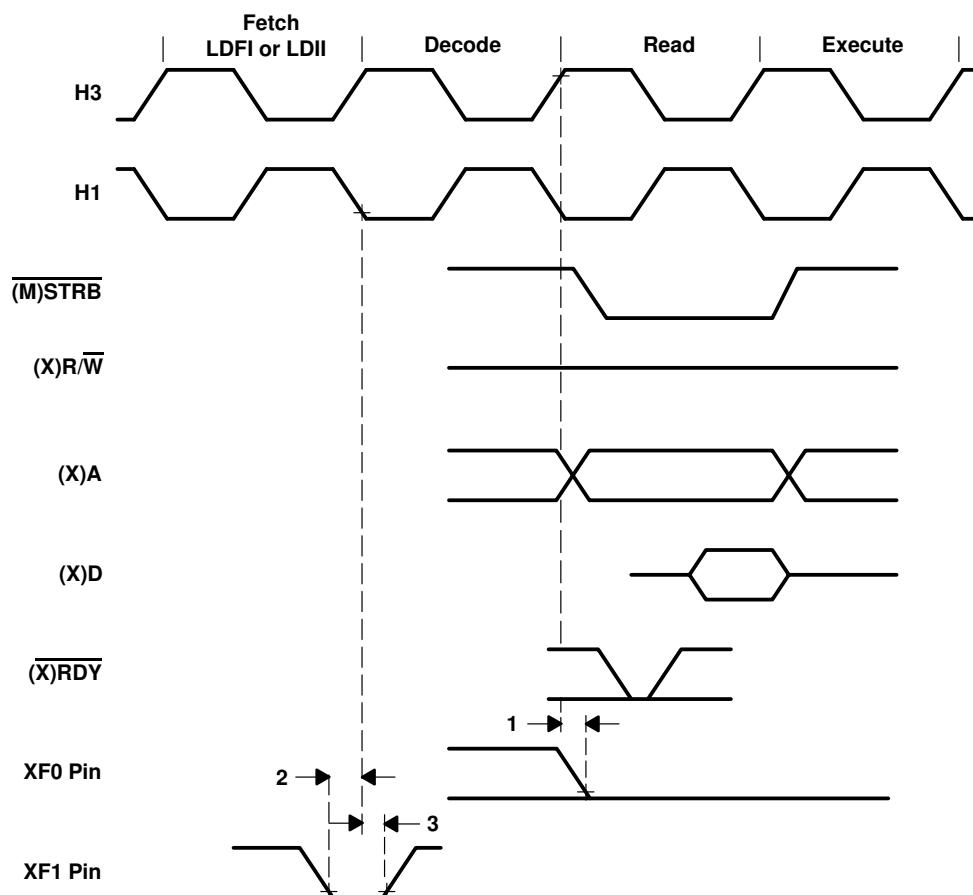

Figure 11. Timing for XF0 and XF1 When Executing LDFI or LDII

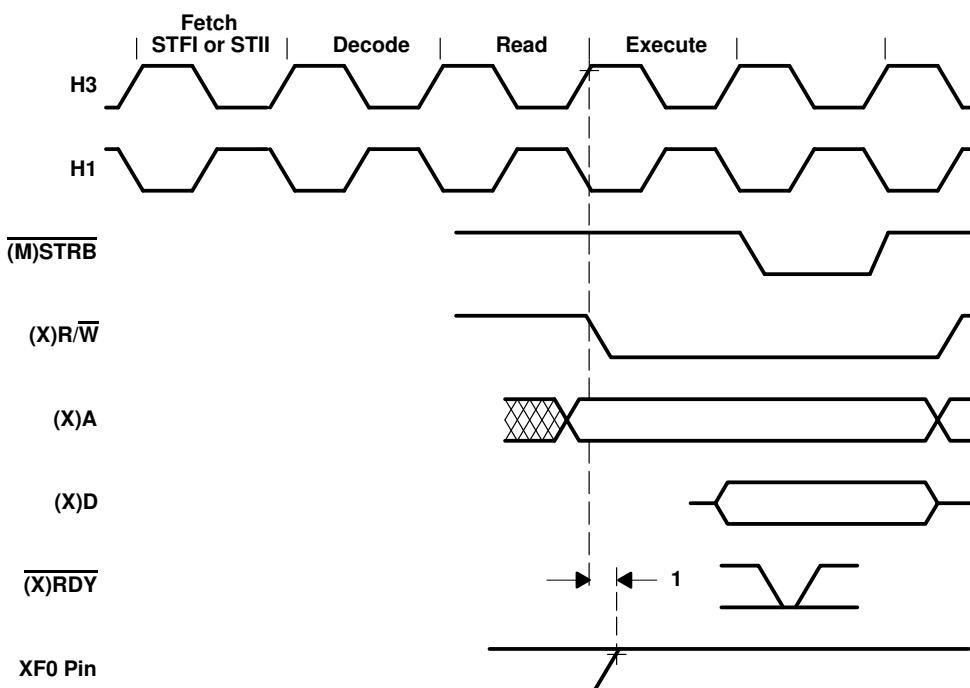

### XF0 timing when executing STFI and STII

The following table defines the timing parameters for the XF0 pin during execution of STFI or STII. The number shown in Figure 12 corresponds with the number in the NO. column of the table below.

**timing parameters for XF0 when executing STFI or STII (see Figure 12)**

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	t <sub>d</sub> (H3H-XF0H) Delay time, H3 high to XF0 high	19		15		13		12		ns

XF0 is always set high at the beginning of the execute phase of the interlock store instruction. When no pipeline conflicts occur, the address of the store is also driven at the beginning of the execute phase of the interlock store instruction. However, if a pipeline conflict prevents the store from executing, the address of the store will not be driven until the store can execute.

**Figure 12. Timing for XF0 When Executing an STFI or STII**

# TMX320C30, TMS320C30 DIGITAL SIGNAL PROCESSORS

SPRS032 – APRIL 1996

## XF0 and XF1 timing when executing SIGI

The following table defines the timing parameters for the XF0 and XF1 pins during execution of SIGI. The numbers shown in Figure 13 correspond with those in the NO. column of the table below.

### timing parameters for XF0 and XF1 when executing SIGI (see Figure 13)

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_d(H3H-XF0L)$	Delay time, H3 high to XF0 low	19	15	13	12	12	12	ns	
2	$t_d(H3H-XF0H)$	Delay time, H3 high to XF0 high	19	15	13	12	12	12	ns	
3	$t_{su}(XF1-H1L)$	Setup time, XF1 before H1 low	13	10	9	9	9	9	ns	
4	$t_h(H1L-XF1)$	Hold time, XF1 after H1 low	0	0	0	0	0	0	ns	

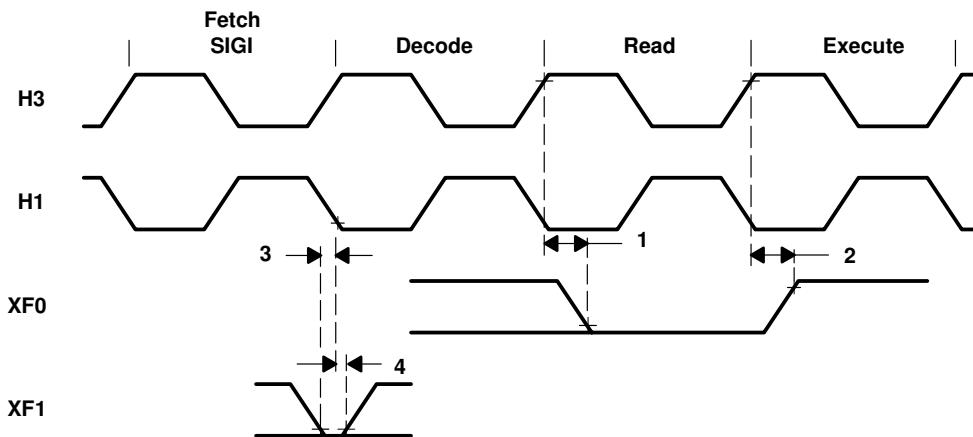

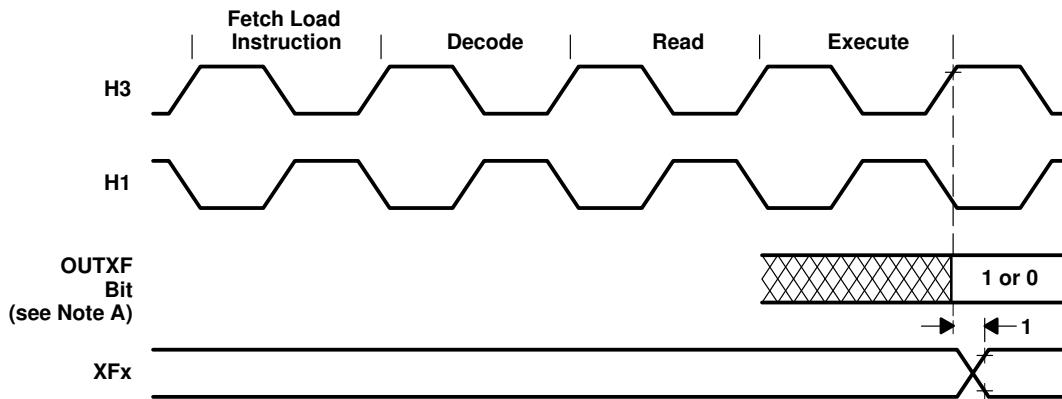

Figure 13. Timing for XF0 and XF1 When Executing SIGI

### loading when XF<sub>x</sub> is configured as an output

The following table defines the timing parameter for loading the XF register when the XF<sub>x</sub> pin is configured as an output. The number shown in Figure 14 corresponds with the number in the NO. column of the table below.

### timing parameters for loading the XF<sub>x</sub> register when configured as an output pin (see Figure 14)

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	t <sub>v</sub> (H3H-XF) Valid time, H3 high to XF <sub>x</sub>		19		15		13		12	ns

NOTE A: OUTXF<sub>x</sub> represents either bit 2 or 6 of the IOF register.

**Figure 14. Timing for Loading XF<sub>x</sub> Register When Configured as an Output Pin**

# TMX320C30, TMS320C30 DIGITAL SIGNAL PROCESSORS

SPRS032 – APRIL 1996

## reset timing

$\overline{\text{RESET}}$  is an asynchronous input that can be asserted at any time during a clock cycle. If the specified timings are met, the exact sequence shown in Figure 17 occurs; otherwise, an additional delay of one clock cycle is possible.

The asynchronous reset signals include XF0/1, CLK0/1, DX0/1, FSX0/1, CLKR0/1, DR0/1, FSR0/1, and TCLK0/1.

The following table defines the timing parameters for the  $\overline{\text{RESET}}$  signal. The numbers shown in Figure 17 correspond with those in the NO. column of the following table.

Resetting the device initializes the primary- and expansion-bus control registers to seven software wait states and therefore results in slow external accesses until these registers are initialized.

Note also that  $\overline{\text{HOLD}}$  is an asynchronous input and can be asserted during reset.

**timing parameters for  $\overline{\text{RESET}}$  for the TMS320C30 (see Figure 17)**

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

### reset timing (continued)

- NOTES:
- A. (X)D includes D31–D0 and XD31–XD0.
  - B. (X)A includes A23–A0 and XA12–XA0.
  - C. Interface signals include STRB, MSTRB, and IOSTRB.
  - D. Asynchronous reset signals include XF0/1, CLKX0/1, DX0/1, FSX0/1, CLKR0/1, DR0/1, FSR0/1, and TCLK0/1.
  - E. RESET is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle is possible.
  - F. The R/W and XR/W outputs are placed in a high-impedance state during reset and can be provided with a resistive pullup, nominally 18–22 kΩ, if undesirable spurious writes could be caused when these outputs go low.
  - G. In microprocessor mode, the reset vector is fetched twice, with seven software wait states each time. In microcomputer mode, the reset vector is fetched twice, with no software wait states.

**Figure 17. Timing for RESET**

# TMX320C30, TMS320C30 DIGITAL SIGNAL PROCESSORS

SPRS032 – APRIL 1996

## interrupt response timing

The following table defines the timing parameters for the  $\overline{\text{INT}}$  signals. The numbers shown in Figure 20 correspond with those in the NO. column of the table below.

### timing parameters for $\overline{\text{INT3}}-\overline{\text{INT0}}$ (see Figure 20)

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_{\text{su}}(\text{INT-H1L})$	Setup time, $\overline{\text{INT3}}-\overline{\text{INT0}}$ before H1 low	19	15	13	10	10	10	10	ns
2	$t_w(\text{INT})$	Pulse duration, interrupt to ensure only one interrupt	P 2P†‡	P 2P†‡	P 2P†‡	P 2P†‡	P 2P†‡	P 2P†‡	P 2P†‡	ns

† Characterized but not tested

‡ P =  $t_c(H)$

The interrupt ( $\overline{\text{INT}}$ ) pins are asynchronous inputs that can be asserted at any time during a clock cycle. The TMS320C30 interrupts are level-sensitive, not edge-sensitive. Interrupts are detected on the falling edge of H1. Therefore, interrupts must be set up and held to the falling edge of H1 for proper detection. The CPU and DMA respond to detected interrupts on instruction-fetch boundaries only.

For the processor to recognize only one interrupt on a given input, an interrupt pulse must be set up and held to:

- A minimum of one H1 falling edge
- No more than two H1 falling edges

The TMS320C30 can accept an interrupt from the same source every two H1 clock cycles.

If the specified timings are met, the exact sequence shown in Figure 20 occurs; otherwise, an additional delay of one clock cycle is possible.

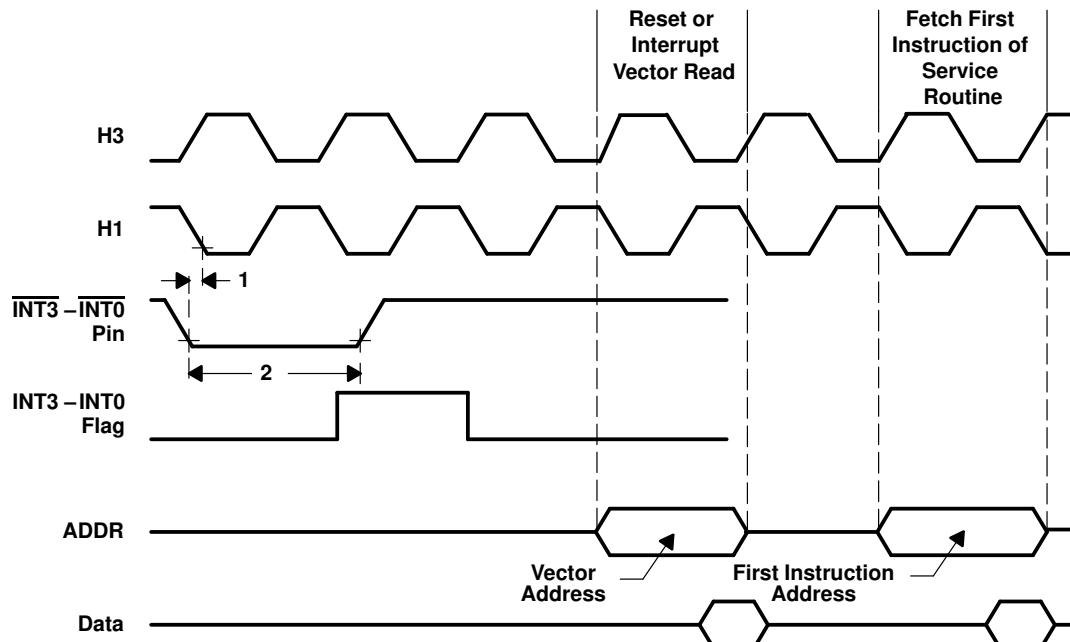

Figure 20. Timing for  $\overline{\text{INT3}}-\overline{\text{INT0}}$  Response

### interrupt-acknowledge timing

The IACK output goes active on the first half-cycle (H1 rising) of the decode phase of the IACK instruction and goes inactive at the first half-cycle (H1 rising) of the read phase of the IACK instruction.

The following table defines the timing parameters for the IACK signal. The numbers shown in Figure 21 correspond with those in the NO. column of the table below.

### timing parameters for IACK (see Notes 6 and 7 and Figure 21)

NO.		'C30-27		'C30-33		'C30-40		'C30-50		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
1	<u>td(H1H-IACKL)</u> Delay time, H1 high to <u>IACK</u> low	13		10		9		7		ns
2	<u>td(H1H-IACKH)</u> Delay time, H1 high to <u>IACK</u> high	13		10		9		7		ns

NOTES: 6. The IACK output is active for the entire duration of the bus cycle and is extended if the bus cycle utilizes wait states.

7. IACK goes active on the first half-cycle (H1 rising) of the decode phase of the IACK instruction and goes inactive at the first half-cycle (H1 rising) of the read phase of the IACK instruction. Because of pipeline conflicts, IACK remains low for one cycle even if the decode phase of the IACK instruction is extended.

SPRS032 – APRIL 1996

## data-rate timing modes

Unless otherwise indicated, the data-rate timings shown in Figure 22 and Figure 23 are valid for all serial-port modes, including handshake. See serial-port timing parameter tables.

- NOTES: A. Timing diagrams show operations with  $\text{CLKXP} = \text{CLKRP} = \text{FSXP} = \text{FSRP} = 0$ .  
B. Timing diagrams depend on the length of the serial port word, where  $n = 8, 16, 24$ , or 32 bits, respectively.

Figure 22. Timing for Fixed Data-Rate Mode

- NOTES: A. Timing diagrams show operation with  $\text{CLKXP} = \text{CLKRP} = \text{FSXP} = \text{FSRP} = 0$ .  
B. Timing diagrams depend on the length of the serial-port word, where  $n = 8, 16, 24$ , or 32 bits, respectively.  
C. The timings that are not specified expressly for the variable data-rate mode are the same as those that are specified for the fixed data-rate mode.

Figure 23. Timing for Variable Data-Rate Mode

---

### **HOLD timing**

**HOLD** is an asynchronous input that can be asserted at any time during a clock cycle. If the specified timings are met, the exact sequence shown in Figure 24 occurs; otherwise, an additional delay of one clock cycle is possible.

The “timing parameters for **HOLD/HOLDA**” table defines the timing parameters for the **HOLD** and **HOLDA** signals. The numbers shown in Figure 24 correspond with those in the NO. column of the table.

The NOHOLD bit of the primary bus control register overrides the **HOLD** signal. When this bit is set, the device comes out of hold and prevents future hold cycles.

Asserting **HOLD** prevents the processor from accessing the primary bus. Program execution continues until a read from or a write to the primary bus is requested. In certain circumstances, the first write is pending, thus allowing the processor to continue until a second write is encountered.
