PREFACE

Represented in SPECS are more than one hundred digital computers, most of them general purpose. To clarify the conception, the definition of a **general purpose computer** in the language of the American Standards Association glossary is: a computer that is designed to solve a wide class of problems. And of a **digital computer**: a computer that operates on discrete data by performing arithmetic and logic processes on these data. And the IBM Glossary for Information Processing defines **computer** as: 1) a device capable of solving problems by accepting data, performing prescribed operations on the data, and supplying the results of these operations. 2) In information processing, usually, an automatic stored program computer.

These are by no means all the computers ever made, nor does it include every one now current. Current and new computer charts will be added as the large amount of information required for SPECS is available. Many of the first generation vacuum tube machines are not included as most are now retired, nor are one-of-a-kind computers included. Older computers included are for historic contrast (such as Univac I, IBM 650 etc.) to the third generation machines with their multiprocessing, multiprogramming, communication, graphics, and visual display capabilities. Today the trend of most large computer manufacturers is toward families (or series) of machines which are upward compatible, i.e., System 360s, Spectra 70s, GE 200, 400, and 600 series, Burroughs 500 series, Control Data's 3000 and 6000 series, Scientific Data Systems new Sigma series, Honeywell 200 series, Univac 9000 series, etc.

The definitions below are included to aid in sharpening understanding and to help in picking the way through the maze of snarled semantics in the data processing field. These definitions are either from the ASA glossary (1966) or the previous Glossary of Automatic Data Processing which the government prepared circa 1962.

Assembler: A program which is used to prepare a machine language program from a symbolic language program by substituting absolute operation codes for symbolic codes and absolute or relocatable addresses for symbolic addresses.

Compiler: A program used to prepare a machine language program from a computer program written in another programming language by making use of the overall logic structure of the program, or generating more than one machine instruction for each symbolic statement, or both, as well as performing the function of an assembler.

Executive Routine: A routine that controls the execution of other routines. Also defined as: a routine which controls loading and relocation of routines and in some cases makes use of instructions which are unknown to the general programmer. Sometimes called Master Control Program.

Generator: A controlling routine that performs a generate function i.e. Report Generator, I/O Generator.

Macro Instruction: An instruction in a source language that is equivalent to a specified sequence of machine instructions. Also: 1) an instruction consisting of a

sequence of micro instructions which are inserted into the object routine for performing a specific operation; 2) the more powerful instructions which combine several operations in one instruction.

Master Control: An application oriented routine usually applied to the highest level of a subroutine hierarchy.

Micro Instruction: A small, single, short, add, shift or delete type of command.

Multiprogramming: A technique for handling numerous routines or programs simultaneously by means of an interweaving process.

Operating System: An organized collection of techniques and procedures for operating a computer. Also: an integrated collection of service routines for supervising the sequencing of programs by a computer. Operating systems may perform debugging, input/output, accounting, compilation, and storage assignment tasks. Sometimes the term is used synonymously for **executive routine**.

Utility Routine: A standard routine used to assist in the operation of the computer; e.g. a conversion routine, a sorting routine, a printout routine, or a tracing routine.

Common Software Acronyms

The acronyms below are the names of widely used software. Proprietary names of software are defined on the contents page found at the beginning of each manufacturer's section.

ALGOL (ALGorithmic Oriented Language) is an international procedure.

APT (Automatic Programming Technique) is for Numerical Control.

ADAPT is a smaller version of APT.

FORTRAN (FORmula TRANslating system) is a programming language designed for problems which can be expressed in algebraic notation, allowing for exponentiation and up to three subscripts. Developed originally by IBM, FORTRAN has been widely adopted.

JOVIAL is a compiler and seemly program, originally developed by System Development Corporation and now adopted by others.

JOSS (Johnniac Open Shop System) is an experimental online computational system developed by the RAND Corporation as a problem solving tool for its scientific/engineering personnel.

LISP is a list processor, developed by Massachusetts Institute of Technology originally for the IBM 704.

MAD (Michigan Algorithmic Decoder), developed by the University of Michigan originally for the IBM 704.

PERT (Program Evaluation and Review Technique) was originally developed by the Naval Ordinance Proving Grounds and has since been widely adopted and expanded to include similar programs such as PERT Cost and PERT Time.

Edith H. Goodman, Editor

GUIDELINES TO COMPUTER SPECS

SPECS contains over a hundred computer charts arranged in 18 sections, as information becomes available in sufficient detail other charts will be added. Each section represents one computer manufacturer, section progression is alphabetical by maker name.

The charts within the sections are arranged in delivery date order (earliest first). This delivery date sequence was chosen to give perspective of the overall historical picture of the computer field. The usual listings by numerical order have been made logically impossible by third generation designations.

Note should be taken that some of the newer, larger machines do not lend themselves to the uniform format.

In order to accommodate greater numbers of certain types of peripherals for some machines (tapes, communications, disks) we have had to expand certain sections for some computer systems. It is advisable to check column headings.

The Master Table of Contents below lists the section sequence.

An individual contents page is at the front of each section, and where necessary the proprietary software explanation is on that page. General software is discussed in the Preface.

As SPECS is updated or revised, new contents pages will be issued.

MASTER TABLE OF CONTENTS

Manufacturer	Computer Designation
ASI (See EMR Computer Division)	
Burroughs Corporation	B
Clary Corporation	DE
Control Data Corporation	CDC
Data Machines, Inc.	Data
Digital Equipment Corporation	PDP
EMR Computer Division (formerly ASI)	Advance
Friden	Friden
General Electric Company	GE
Honeywell	H
International Business Machines, Inc.	IBM
Logic Corporation	LC
Monroe International, Inc.	Monrobot
National Cash Register	NCR
Pacific Data Systems	PDS
Scientific Control Corporation	SCC
Radio Corporation of America	RCA
Scientific Data Systems	SDS, Sigma
SCM	SCM
Univac, division of Sperry Rand Corporation	Univac

1. Star with number indicates bytes, if byte machine.

2. M XXX is number of units per system if the I/O device is necessary to minimal machine configuration. O XXX indicates device is optional. The subscript, XXX, refers to maximum number of units per system.

3. Sales price indicated by subscript to S, where system is for sale only.

** Purchase price, if not available on rental basis.

Floating Point-Standard. 10 arithmetic and logical units; add, multiply, multiply, divide, long add, shift, branch, boolean, increment, increment, 8 operand registers (60 bit) 8 address registers (18 bit) 8 increment (index) (18 bit) An instruction stack holding 16 to 32 instructions.	Yes on peripheral processors No on central processor	8	none	no.	9/64	The 6600 system contains 11 physically integrated but logically independent processors; 1 central processor for problem programming and 10 peripheral processors for monitor, systems and I/O functions. The central processor multiprograms from central memory with hardware program protect features. The central processor has no I/O commands. All I/O is accomplished by peripheral processors upon signals to do so from central. The peripheral processors and central processor execute simultaneously thereby multiprocessing. Central Memory Banking and Operand Register Concept allows a new memory access every 100 nanoseconds.

Floating Point-Standard 8 operand registers (60 bit) 8 address registers (18 bit) 8 increment (index) (18 bit) Instruction buffer register (60 bit)	Yes on peripheral processors No on central processor	8	none	no.	5/66	The 6400 system contains 11 physically integrated but logically independent processors; 1 central processor for problem programming and 10 peripheral processors for monitor, systems and I/O functions. The central processor multiprograms from central memory with hardware program protect features. The central processor has no I/O commands. All I/O is accomplished by peripheral processors upon signals to do so from central. The peripheral processors and central processor execute simultaneously thereby multiprocessing. Central Memory Banking and Operand Register Concept allows a new memory access every 100 nanoseconds.

1. Star with number indicates bytes, if byte machine.
 2. M XXX is number of units per system if the I/O device is necessary to minimal machine configuration. 0 XXX indicates device is optional. The subscript, XXX, refers to maximum number of units per system.
 3. Sales price indicated by subscript to S, where system is for sale only.
 ** Purchase price, if not available on rental basis.

SOFTWARE

(for general software, see Preface)

BANKPAC: series of generalized programs for commercial banking
GAP: general assembly program
GECOM: general compiler system (processes COBOL-type, ALGOL-type
statements, structured decision table; TABSOL, and a language for
Report Generator)
WIZ: algebraic compiler
GE 115 TAB: tabulating to 115 conversion
GE 100: a one for one assembler
I-D-S: integrated data store (mass storage devices; an extension of COBOL)

SOFTWARE

ARGUS: Automatic Routine Generating and Updating System
EASY: Source language
EASY TAB: Group of software programs written in COBOL B to simulate functions of specific data processing equipment
LIBERATOR PROGRAMS (Honeywell 200 series) include EASYTRAN-SPS or Autocoder to EASYCODER conversion and BRIDGE-translates 1400 series machine language to Honeywell 200 series machine language
EASYCODER: Assembler

SOFTWARE

(for general software, see Preface)

Berkley Time Sharing Software System

META-SYMBOL: high level symbolic assembly language and processor

MONARCH: operating system for 900 series

PINT: Purdue Interpretive Language System: translator

SYMBOL: assembler

ADDITIONAL SOFTWARE FOR SIGMA 2:

General Debug, Concordance: additional documentation for general
reference and faster debug.

System Generator

Math Library

Batch Monitor and Universal-Time Share Monitor Operating Systems

SOFTWARE FOR SIGMA 7:

MANAGE: for business data file handling

Report Generator

Generalized sort/merge

1400 Series Simulator

		Standard Number	Optional Number			
Not available	Standard	2	0	4 Standard	12/66	Recent developments in the computer industry have invalidated the distinction between drum and disk storage. In the past, drum storage utilized one read/write head per track whereas disk storage utilized moveable read/write heads. Consequently, drum storage provided faster access and higher transfer rates than disk files. At present, however, some drum stores utilize movable read/write heads while some disk stores utilize one read/write head per track. This means that the only valid distinction between disk and drum is the physical shape of the rotating magnetic surface. SDS provides both disk and drum storage; both types utilize one fixed read/write head per track. These units are identified solely by their access time and transfer rate.

1. Star with number indicates bytes, if byte machine.
 2. M XXX is number of units per system if the I/O device is necessary to minimal machine configuration. 0 XXX indicates device is optional. The subscript, XXX, refers to maximum number of units per system.
 3. Sales price indicated by subscript to S, where system is for sale only.
 ** Purchase price, if not available on rental basis.

/A minimum computer configuration must include at least one input/output device. This can either be a console typewriter with paper-tape I/O system (Model 8092) or it can be a card device. Because Model 8092 is the least expensive means of providing both input and output, it is usually cited as the one peripheral unit necessary for a minimal machine configuration.
