INTRODUCTION

This booklet presents the salient hardware features of the CONTROL DATA® 7600 Computer System. For complete information on the 7600 Computer System, refer to the Control Data 7600 Computer System Reference Manual, Publication number 60258200.

7600 SYSTEM

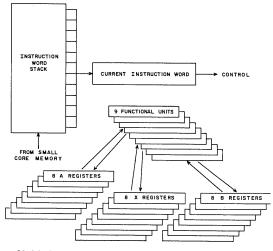

CENTRAL PROCESSING UNIT (CPU)

- 60-bit Computation Section
- 60-bit Small Core Memory (65,536 words) plus parity
- 60-bit Large Core Memory (512,000 words) plus parity
- CPU Input/Output Multiplexer (15 channels)

PERIPHERAL PROCESSING UNITS (PPU)

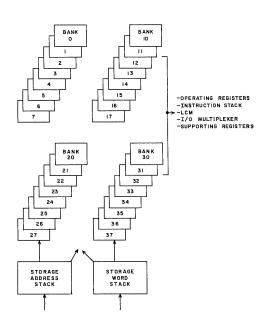

- 12-bit computation section
- 8 fully duplex data channels
- 12-bit memory (4,096 words) plus parity

CENTRAL PROCESSING UNIT (CPU) CPU COMPUTATION SECTION

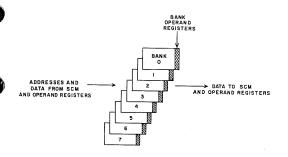

- 60-bit internal word
- binary computation in fixed and floating point format
 - 12-word (60 bits) instruction stack
- 24 operating registers
 8 18-bit A registers
 8 18-bit B registers
 8 60-bit X registers
- nine independent functional units
 - Long Add Floating Add Floating Multiply Floating Divide Boolean Shift Normalize Population Count Increment
- Synchronous internal logic with 27.5 nanosecond clock period

CPU SMALL CORE MEMORY (SCM)

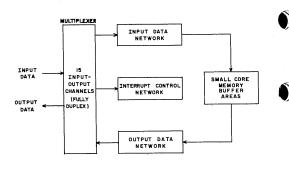

- 65,536 words of coincident current memory (60 bits plus parity)
- 32 independent banks; sequential addresses in separate banks
- 2048 words per bank
- 275 nanosecond read/write cycle time
- 27.5 nanosecond per word maximum transfer rate

CPU LARGE CORE MEMORY (LCM)

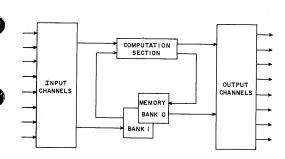

- 512,000 words of linear select memory (60 bits plus parity)
- 8 independent banks, each with an 8-word operand holding register
- 64,000 words per bank
- 1760 nanosecond read/write cycle time
- 8 words read simultaneously into bank operand register each reference; if addressed word is in bank operand register, no memory access is required
- 27.5 nanosecond per word maximum transfer rate
- operands directly accessible by CPU

CPU INPUT/OUTPUT SECTION

- 15 independent channels (asynchronous)
- each channel fully duplex
- buffer areas of 128 words each channel; buffer area sizes can be changed by wiring change
- 55 nanoseconds per 60-bit word maximum transfer rate to SCM

COMPUTATION SECTION

- 12-bit internal word
- · binary computation in fixed point
- synchronous internal logic with 27.5 nanosecond clock period

CORE MEMORY

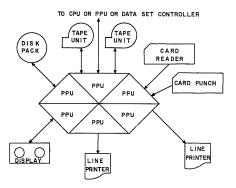

- 4096 words of coincident current memory (12 bits plus parity)
- two independent banks; consecutive addresses to alternate banks
- 2048 words per bank
- 275 nanosecond read/write cycle time

INPUT/OUTPUT SECTION

- 8 independent channels (asynchronous)
- each channel fully duplex (12-bit)
- 137.5 nanoseconds per 12-bit word maximum transfer rate

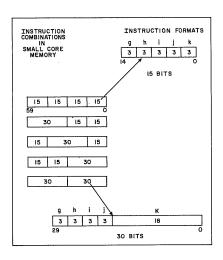

PERIPHERAL EQUIPMENT CONFIGURATIONS

Peripheral equipments are attached to a cluster of interconnected PPU's to form an I/O station. Such a station can communicate with the multiplexer in the CPU directly or via another PPU. A representative configuration is shown below.

This diagram is necessarily simplified to basic data paths.

CENTRAL PROCESSING UNIT

EXPLANATION OF SYMBOLS USED IN CENTRAL PROCESSOR INSTRUCTION LISTINGS

- A One of eight address registers (18 bits)
- B One of eight index registers (18 bits)
- gh Instruction code (6 bits)
- i Specifies which of eight designated registers (3 bits). Is also used in some instructions as part of the operation code.
- j Specifies which of eight designated registers (3 bits)
- k Specifies which of eight designated registers (3 bits)
- K Constant, indicating branch
- X One of eight operand registers (60 bits)

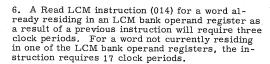

CENTRAL PROCESSOR TIMING NOTES

 Times given include clock periods known to occur before instruction issue, but do not consider register conflict conditions that might delay issue.

Except for the multiply and divide units, all functional units permit new instructions to enter them every clock period. A new instruction may enter the multiply unit in any clock period, provided there was no operation initiated in the preceding clock period. A new instruction can enter the divide unit two clock periods prior to completion of a previous divide operation. Once an instruction issues to a functional unit, it is executed in a fixed amount of time. No delays are possible.

Times given for instructions 01 to 07 and 50 to 57 do not consider memory conflict conditions or SAS back-up conditions caused by bank conflicts.

- 2. Execution of Block Copy instructions (011 and 012) will be delayed until the following conditions are satisfied:
 - a. All operating registers are free.
 - b. No SCM bank conflicts exist.
 - c. LCM is not busy.
- 3. A delay will occur during instructions 011 and 012 when an I/O section word request is made. A minimum delay of one clock period is required to enter the I/O word address in the address stream to the SAS. An additional delay will occur if the I/O reference causes a bank conflict in SCM.
- 4. A delay will occur in the execution of the Exchange Exit instruction (013) until two conditions are satisfied:
 - a. All operating registers are free.
 - No SCM bank conflicts exist.
- The Read LCM and Write LCM instructions (014 and 015) will not issue until three conditions are satisfied.
 - LCM is not busy.
 - b. Xj register is free.
 - c. Xk register is free.

- 7. The Reset Buffer instructions and Read Channel Status instructions (016 and 017) will not issue and begin execution until the required B registers are free.
- 8. Jump instruction 02i0K will not begin execution until the Bi register is free. Instruction execution will also be delayed if an instruction fetch is in process.
- 9. The execution of a branch instruction (030 to 037, 04ijk, 05ijk, 06ijk and 07ijk) will be delayed if an instruction fetch is in process.
- 10. Instructions 10 to 47 and 60 to 77 will not issue until the following conditions are satisfied:
 - a. The required A, B, and X registers are free.
 - b. X and B register input paths will be free during the required clock period.
 - c. No SAS backup condition exists.
 - d. The multiply unit is free (instructions 40, 41, and 42 only).
 - e. The divide unit is free (instructions 44 and 45 only).
- 11. Instructions 50 to 57 will not issue until the following conditions are satisfied:
 - a. The required A, B, and X registers are free.
 - b. No SAS backup condition exists.
- 12. A delay may occur in the execution of the Return Jump instruction (0100K) if the instruction stack control has requested one or more instruction words that have not arrived at the instruction stack (likely to occur in straight line coding).

PERIPHERAL PROCESSING UNIT INSTRUCTIONS

EXPLANATION OF PERIPHERAL PROCESSOR INSTRUCTION FORMATS

An instruction may have a 12-bit or a 24-bit format. The 12-bit format has a 6-bit operation code F and a 6-bit operand or operand address d.

The 24-bit format uses the 12-bit quantity m, which is the contents of the next program address (P+1), with d to form an 18-bit operand or operand address.

EXPLANATION OF SYMBOLS USED IN PERIPHERAL PROCESSOR INSTRUCTION LISTINGS

(d) Implies the contents of d.

((d)) Implies the contents of the location specified by d.

m (m + (d)) The contents of d are added to m to form an operand (jump address).

The contents of d are added to m to form the address of the operand.

Implies an 18-bit quantity with d as the upper 6 bits and m as the lower 12 bits.

Implies d itself.

d

PERIPHERAL PROCESSOR INSTRUCTIONS

MNE- MONIC	INSTRUC- TION CODE (Octal)	NAME	EXECUTION TIME
CODE	(Octai)	NAME	(Clock
1737731	00		Periods)

LDC	20	Load dm	10
ADC	21	Add dm	10
LPC	22	Logical product dm	10
LMC	23	Logical difference dm	10

NOTES

- Where more than one time is given, the shorter time is obtained when full use of bank phasing (backto-back storage references to alternate banks) is made.
- 2. Conditional jump instructions list times for the "jump not taken" case. Add 3 or 5 clock periods for the "jump taken" case, depending on the value of d.
- For the 10 (shift) instruction: Minimum time is required if the shift count(3; for shift counts > 3, add 1 clock period per shift beyond 3 to the minimum time.

			Dead Start)

⁺Timing for these instructions are sample times only for various cases. Assumptions made for each case are stated on the following page.

⁺⁺Assumes output channel d word flag is clear; if not clear, add the time waiting for flag to clear.

71 INSTRUCTION

Case 1: Assume:

- a block input terminated by a record flag rather than by decrementing (A) to zero.
- a 2 clock period response time between the resume and the word flag.
- c. a 3-word block followed by a record flag.
- d. the channel d input word flag is set at instruction initiation, and
- the first data reference is to the alternate storage bank.

Execution Time = 42 clock periods.

Case 2: Assume:

- a. a block input terminated by reducing (A) to zero.
- o. same response as in item b, Case 1.
- c. a count of 2 in the A register, and
- d. items d and e in Case 1 are true.

Execution Time = 24 clock periods.

Case 3: Assume:

a. a block input initiated with (A) = zero.

Execution Time = 10 clock periods.

73 INSTRUCTION

Case 1: Assume:

- a. a count of 3 in the A register.
- the device has a 2 clock period response time from receipt of word pulse to transmission of resume pulse.
- c. the output channel d word flag is clear, and
- d. the first word of the block is read from the alternate storage bank.

Execution Time = 34 clock periods.

Case 2: Assume:

a. a block output initiated with (A) = zero.

Execution Time = 10 clock periods.
