## **SECTION I INTRODUCTION**

The purpose of this supplement is to aid in servicing the HP 85001A Cassette Input/Output Unit. It contains information not found in the DICOM 344 Interface Reference and Maintenance manuals. Refer to these manuals for clarification of the terms used in this supplement.

This supplement applies to an 85001A used with any Hewlett-Packard 2100-series computer.

The 85001A Service Diagram (see Section VI) is a valuable guide to troubleshooting the Cassette Input/Output Unit.

## **SECTION II**

## **TROUBLESHOOTING GUIDE**

### **INTRODUCTION**

The flowchart in Figure 2-1 is a rough guide to troubleshooting the 85001A. There are three major software tools for troubleshooting the 85001A—(1) the EXEC program, (2) the AUTO Diagnostic, and (3) the Switch Register Diagnostic.

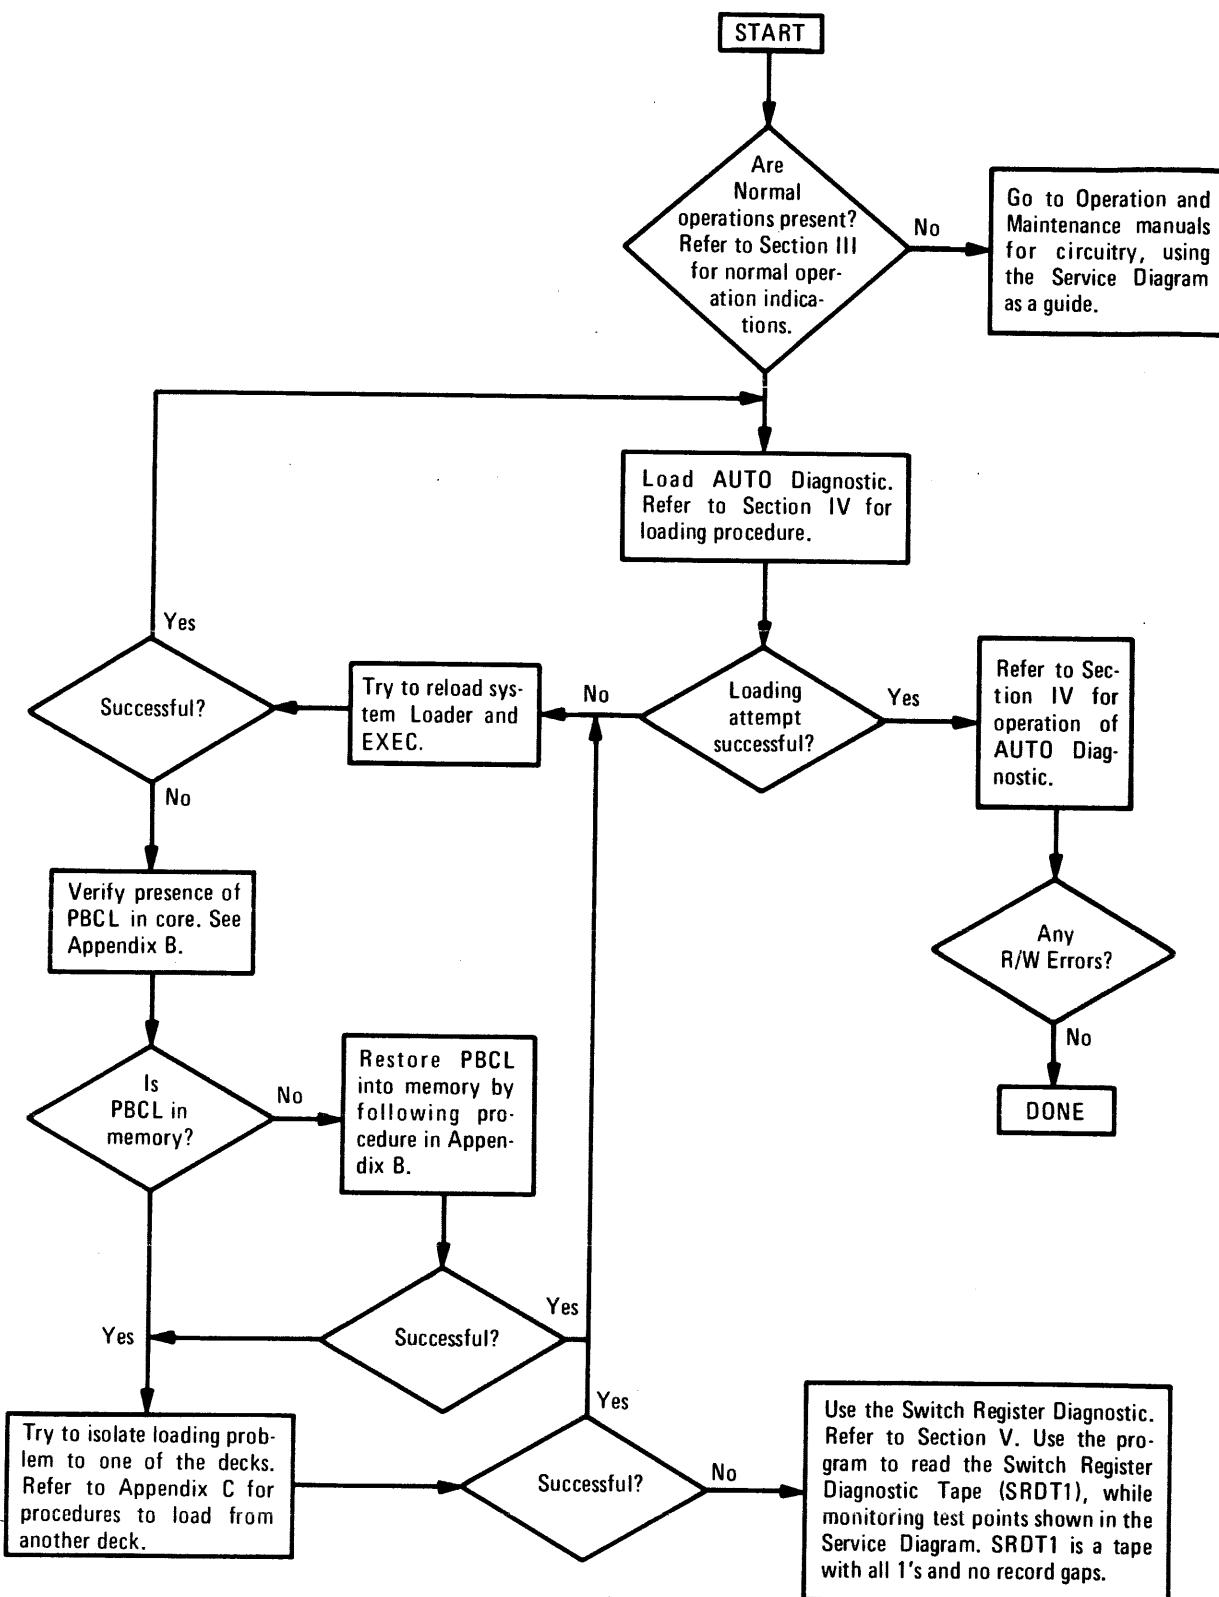

Figure 2-1. Troubleshooting Flowchart

## SECTION III

### NORMAL OPERATION INDICATIONS

Table 3-1 shows the front panel indications of normal operation of the 85001A Cassette Input/Output Unit.

*Table 3-1. Normal Operation Indications*

Sequence	Operator's Action	Normal Operation Indication
1.	Select ON LINE	All front panel controls (except OFF LINE) are disabled.
2.	Insert a blank cassette into a deck; press the loader down, and select HALT mode.	The READY lamp above the deck illuminates.
3.	With deck READY, select OFF LINE mode and then select WRITE.	Tape will be in motion for a couple of seconds (to get past clear leader) and then HALT. The WRITE pushbutton will stay lit until HALT is pushed.
4.	Again select WRITE.	No effect. Again push HALT.
5.	Select READ, then 5 seconds later, push HALT.	Tape will be in motion until HALTED.
6.	Press WRITE and OFF LINE together.	Tape will be in motion for a fraction of a second; deck writes a FILE MARK and HALTs.
7.	Rewind tape by pushing REWIND pushbutton.	Tape will be in motion while rewinding, then will HALT.
8.	Select READ.	Tape will be in motion for 5 seconds (until it encounters the FILE MARK written in step 6). It is normal if the HALT lamp blinks.
9.	Remove cassette and re-insert upside-down (to start at EOT).	Tape will rewind from end-of-tape (EOT) to beginning-of-tape (BOT).

## SECTION IV

### 85001A AUTO DIAGNOSTIC

#### INTRODUCTION

This section describes the 85001A AUTO Diagnostic. The AUTO Diagnostic fully checks every ON LINE function and deck-to-deck compatibility. It performs these checks in a certain order and communicates with the operator via the print-out device.

#### LOADING THE 85001A AUTO DIAGNOSTIC

Load the AUTO Diagnostic from deck 1 using the EXEC. Since the AUTO Diagnostic is the third file on the cassette (the first two files are standard test files) the command is LOAD 3 FROM 1. Appendix D contains instructions for using the EXEC, including more general use of the LOAD command.

#### SUMMARY OF OPERATION

The AUTO Diagnostic makes four separate tests. These tests are outlined in Table 4-1.

*Table 4-1. Summary of AUTO Diagnostic Tests*

Test 1	Reads two standard test files from test cassette.
Test 2	Skips first file, then reads second file from test cassette.
Test 3	Writes standard test files onto reverse side of test cassette.
Test 5	Checks for write-protect and long rewind.

#### TEST CASSETTES

The AUTO Diagnostic requires at least one "test cassette". Three such cassettes are needed for a complete check of the unit. The first two files of the Diagnostic Tape are standard test files. They may be used to verify performance on any one deck. That deck can then generate "test cassettes".

A test cassette has two standard test files written on one side, and the write-protect tab removed from that side. The reverse side is blank so that the 85001A can write on it. Table 4-2 describes the two standard test files.

*Table 4-2. Standard Test Files*

File 1	Contains one record consisting of one 16-bit word, all octal "1"s. The file mark for File 1 is one byte of all binary "1"s.
File 2	Contains twenty records; each record contains 200 words (400 bytes). Starting with 000 and ending with 377, each byte is one octal greater than the preceding one. The file mark for File 2 is one byte of all "0"s.

The AUTO Diagnostic performs the tests in groups; the sequence of tests described in Table 4-3 assumes the operator has selected switches 1, 2, 3, and 5 on the computer's switch register. To perform any of the tests independent of the sequence, select the switch that has the same number as the test to be performed (switch 3 for Test 3, for example).

*Table 4-3. Summary of 85001A AUTO Diagnostic Groups*

Group 1	Each deck selected runs Tests 1 and 2 (in that order).
	Each deck selected runs Tests 3, 1, and 2 (in that order).
Group 2	Group 2 may be cycled (looped) by selecting switch 15 also. Test cassettes may be created by running only Test 3.
Group 3	Shift all cassettes — put cassette from Deck 1 into Deck 2, cassette from Deck 2 into Deck 3, and cassette from Deck 3 into Deck 1. Repeats Tests 1 and 2 (in that order).
Group 4	Shift again; If yes, then it repeats Tests 1 and 2 (in that order).
Group 5	Each deck selected runs Test 5.

## OPERATING PROCEDURE

The AUTO Diagnostic should be loaded using the EXEC. The starting address is 100 (octal). During program execution, it will pause for operator action (such as loading cassettes, etc.). After the operator action is completed, type a space (CR) to continue. Any time the program is waiting for operator input, you may type CONTROL-C (CR) to bailout and restart the program.

Run the 85001A AUTO Diagnostic as follows:

1. When the AUTO Diagnostic is loaded, it will print PUT TEST #S. IN SW REG (1-5). Select switches 1, 2, 3, and 5 on the computer switch register. Then type a space (CR).
2. The program will print ENTER TEST DK #S. Type in up to three deck numbers in any order (123) (CR).
3. The program will print INSERT GOOD TAPES. Insert test cassettes into the decks to be tested. Type a space (CR).
4. The program will print DK X EOF twice (X will be 1, 2, or 3). The tape will then rewind to beginning-of-tape, and program will print DK X TST 1 DN (meaning that Test 1 on Deck X is completed). The tape will then skip the first file and will read the second. The program will print DK X EOF again, then rewind and print DK X TST 2 DN. It will repeat this procedure for each deck that was selected in step 2.

Since the program tells when each test is completed, any errors may be pinpointed to the proper test.

Step 4 checks all READ and SEARCH functions. If the unit fails these tests, the program should be stopped at this point to find out why. The next series of tests writes on the reverse side of each test cassette, and then reads what was written. If the READ functions are not operating properly there is no way to check the WRITE functions. To stop the AUTO Diagnostic, type CONTROL-C (CR) after it prints INSERT BLANK TAPES.

5. The program will print INSERT BLANK TAPES. Turn the test cassettes over, and re-insert them into the decks. When they have rewound, type a space (CR). The program will write standard test files on each deck selected, and will print DK X TST 3 DN. It will then repeat step 4 to check what it has written.

If switch 15 is selected, this series of tests will repeat until switch 15 is reset. This feature is useful for troubleshooting intermittent problems.

**OPERATING PROCEDURE (cont'd)**

6. The program will print SHIFT ALL CASSETTES. The operator should move all cassettes to the right (put cassette from Deck 1 into Deck 2, cassette from Deck 2 into Deck 3, and cassette from Deck 3 into Deck 1). Then type a space (CR).

Step 4 is repeated for all decks selected. This tests deck-to-deck compatibility.

7. The program will print SHIFT AGAIN; If no errors occurred in step 6, type a space (CR) to continue without shifting again.

If errors occurred in step 6, a bad deck may be isolated by shifting again. Type YES (CR). For example, if Deck 1 is written on, but when cassette is placed in Deck 2 it cannot be read, the malfunction could be in either 1 or 2. By shifting again to Deck 3, the bad deck may be isolated.

8. The program will print TURN CASSETTES OVER. Remove the cassettes from all decks and turn off power to the 85001A. Turn the test cassettes back over (to the side with the write-protect tab removed) and re-insert them into the decks. Now turn back on the power and type a space (CR). All three decks should start rewinding and should go READY at approximately the same time (within 10 seconds of each other). When they are READY, the program will print DK X W.P. for each deck selected, then print TURN CASSETTES OVER. Turn the test cassettes back over and re-insert them into the decks. When the cassettes rewind, the program will print DK X NO W.P. for each deck.
9. The program will print END DIAG and return to step 1.

Table 4-4 shows a typical printout of the AUTO Diagnostic.

Table 4-4. Typical Printout, 85001A AUTO Diagnostic

PUT TEST # S IN SW REG (1-5)	► SHIFT ALL CASSETTES
ENTER TEST DK # S	DK 1 EOF
123	DK 1 EOF
INSERT GOOD TAPES	DK 1 TST 1 DN
DK 1 EOF	DK 1 EOF
DK 1 EOF	DK 1 TST 2 DN
DK 1 TST 1 DN	DK 2 EOF
DK 1 EOF	DK 2 EOF
DK 1 TST 2 DN	DK 2 TST 1 DN
DK 2 EOF	DK 2 EOF
DK 2 EOF	DK 2 TST 2 DN
DK 2 TST 1 DN	DK 3 EOF
DK 2 EOF	DK 3 EOF
DK 2 TST 2 DN	DK 3 TST 1 DN
DK 3 EOF	DK 3 EOF
DK 3 EOF	DK 3 TST 2 DN
DK 3 TST 1 DN	SHIFT AGAIN?
DK 3 EOF	TURN CASSETTES OVER
DK 3 TST 2 DN	
INSERT BLANK TAPES	
DK 1 TST 3 DN	DK 1 W.P.
DK 1 EOF	DK 2 W.P.
DK 1 EOF	DK 3 W.P.
DK 1 TST 1 DN	TURN CASSETTES OVER
DK 1 EOF	
DK 1 TST 2 DN	
DK 2 TST 3 DN	DK 1 NO W.P.
DK 2 EOF	DK 2 NO W.P.
DK 2 EOF	DK 3 NO W.P.
DK 2 TST 1 DN	
DK 2 EOF	
DK 2 TST 2 DN	
DK 3 TST 3 DN	END DIAG
DK 3 EOF	
DK 3 EOF	
DK 3 TST 1 DN	
DK 3 EOF	
DK 3 TST 2 DN	

## CREATING TEST CASSETTES

To create one or more test cassettes, run the AUTO Diagnostic by only selecting Test 3. For each deck selected, the 85001A will write two standard test files for use on other decks.

## AUTO DIAGNOSTIC ERRORS

The AUTO Diagnostic will print out errors if any occur. The following list explains these errors and their possible causes:

**DK X NOT RDY.** The selected deck was not ready. The loader may not be pushed down, the cassette may be rewinding after insertion, or the 85001A may be in OFF LINE. Recovery—Ready the deck, then type a space (CR).

**DK X NO LEADER.** The selected deck was not on clear leader. If this occurred at the beginning of the program, it may mean that the automatic-rewind-upon-insertion feature did not work. If it occurred during the tests, it means that a rewind was aborted before it was completed. This is usually caused by a warped cassette or a sticky deck stopping the rewind process. If the rewind is stopped for even a short time (200 ms.), the tachometer (used to sense motion) will time out and the deck will go READY. Recovery—Rewind the deck (OFF LINE or by lifting the loader lip) and type a space (CR).

**DK X R/W ERR.** A read/write error occurred on the selected deck. This error has many possible causes. The most likely cause is a random dropped bit while reading or writing. The method of writing data on the cassette allows for a hardware parity check while the data is read. A read/write error will occur if the 85001A does not read 8 bits per character, or if it reads an odd number of flux reversals. The random error rate of the 85001A should be less than 1 error per  $2 \times 10^8$  bits. If errors occur more frequently, it is a sign of something wrong in the 85001A or the cassette itself. If a read/write error occurs consistently at one spot in the cassette, the tape may be creased there or the oxide is separated from its mylar backing. If the errors are more random, they may be caused by dirt on the tape path (head or buffer spring/pressure pad), or a mechanical or electrical malfunction in the 85001A. The cassette driver will also indicate a read/write error if the unit is placed in OFF LINE while reading or writing. The driver gives this indication by noting the absence of read status, write status, or deck ready status. Recovery—Type a space (CR) to continue the diagnostic. The driver will truncate the record at the point of the R/W error. Type CONTROL-C (CR) to return to the beginning of the AUTO Diagnostic.

**DK X W LKOUT.** An attempt was made to write on a cassette with the write-protect tab removed. Recovery—Remove the cassette and insert a non-protected one. Type a space (CR) to continue.

**DK X EOT.** The cassette was at end-of-tape while trying to perform a read or write operation. Since the AUTO Diagnostic does not try to read or write a complete tape, this error usually means that a cassette was inserted upside down and did not rewind automatically upon insertion. Recovery—Turn cassette over or rewind it.

**RECORD X SIZE ERROR.** The record #X (X = 1 to 21) that was read from the tape was not the size expected. Record 1 should be one word, and records 2 through 21 should be two-hundred words each. This error message will be followed by “IS” “SHOULD BE”, with the actual record size printed under “IS”, and the expected size printed under “SHOULD BE”.

**RECORD X CONTENT ERROR** The contents of record X read from the tape did not match the expected contents. The AUTO Diagnostic prints the values read and the expected values in the “IS” “SHOULD BE” format. Patterns in the differences between the expected and actual contents are a valuable clue to the nature of the hardware problem. These errors may be grouped into one of three categories. Printing will stop

and the 85001A will move on to the next record by selecting switch 0 on the computer's switch register.

A. IS SHOULD BE

000	004	
001	005	
002	006	
003	007	
010	014	
011	015	

This pattern represents one bit missing (bit 2). Since the 85001A is internally a serial device and this is a parallel problem, the I/O card or cable is probably at fault.

B. IS SHOULD BE

001	000	
002	001	
003	002	
004	003	

This pattern may be caused by slow up to speed on read or by fast up to speed on write. When continued, it gives record size error of 1 vs. 200.

c. IS SHOULD BE

002	001	
004	002	
006	003	
010	004	
012	005	
014	006	

This pattern indicates shifted bits in the data while it is still in serial form. The fault is probably in the timing.

## SECTION V

### SWITCH REGISTER DIAGNOSTIC

#### INTRODUCTION

The Switch Register Diagnostic may be used to control 85001A functions manually from the computer's switch register. This diagnostic is a valuable servicing tool. It allows the technician to monitor test points throughout the 85001A with an oscilloscope and observe the effect of changing functions. Refer to the Service Diagram (Figure 6-3) for the test points, and to Appendix A for the descriptions of each test point in the 85001A.

#### OPERATING PROCEDURE FOR HP 2100 COMPUTER

Use the following procedure to load the Switch Register Diagnostic into core:

1. Load instructions contained in Table 5-1 into computer's core memory.

*Table 5-1. Switch Register Control Program (2100)*

Input these instructions into memory:	At these addresses:	Machine Instruction
102501	200	LIA 01
102610	201	OTA 10
106510	202	LIB 10
106601	203	OTB 01
103710	204	STC, C 10
102310	205	SFS 10
024205	206	JMP*-1
024201	207	JMP*-6

Note: The set of instructions above assumes the 85001A is in I/O channel 10. If using any other I/O channel, the instructions must be modified in addresses 201, 202, 204, and 205.

2. Set the P-register to 200<sub>8</sub>.
3. Enter command from Table 5-3 into computer's switch register.
4. Press PRESET, then press RUN. The status bits will replace the command in the Switch Register as soon as the command is accepted by the 85001A.

#### CAUTION

When issuing a command, the cassette will try to pull tape until the computer is HALTED. Failure to HALT the computer when the cassette is at EOT (end-of-tape) will result in permanent damage to the pinch roller. It is therefore important to HALT the computer before EOT. EOT is indicated by bit 12 in the computer's switch register (LEADER/OXIDE).

#### CAUTION

When at BOT (beginning-of-tape) due to a rewind command, the tachometer will time out and the rewind idler will periodically try to rewind the tape. This will be noted by the rewind solenoid opening and closing, causing the head arm assembly to chatter back and forth as the head goes in and out. Immediately HALT the computer.

**OPERATING PROCEDURE FOR HP 2114/2115/2116 COMPUTER**

1. Load instructions contained in Table 5-2 into computer's core memory.

*Table 5-2. Switch Register Control Program  
(2114, 2115, and 2116)*

Input these instructions into memory:	At these addresses:	Machine Instruction
102501	200	LIA 01
102610	201	OTA 10
106510	202	LIB 10
103710	203	STC, C 10
102310	204	SFS 10
024204	205	JMP*-1
024200	206	JMP*-6

Note: The set of instructions above assumes the 85001A is in I/O channel 10. If using any other I/O channel, the instructions must be modified in addresses 201 through 204.

2. After loading instructions in Table 5-2, load address 200<sub>8</sub>.
3. Enter command from Table 5-3 into computer's switch register.
4. Press PRESET, then press RUN.

**CAUTION**

When issuing a command, the cassette will try to pull tape until the computer is HALTED. Failure to HALT the computer when the cassette is at EOT (end-of-tape) will result in permanent damage to the pinch roller. It is therefore important to HALT the computer before EOT. EOT is indicated by bit 12 in the computer's B-register (LEADER/OXIDE).

**CAUTION**

When at BOT (beginning of tape) due to a rewind command, the tachometer will time out and the rewind idler will periodically try to rewind the tape. This will be noted by the rewind solenoid opening and closing, causing the head arm assembly to chatter back and forth as the head goes in and out. Immediately HALT the computer.

Table 5-3. Switch Register Commands

Mode	Deck 1	Deck 2	Deck 3
WRITE. Enter 8-bit word in switches 0-7. Status bits 9 (FLAG) and 10 (WRITE) are set in the B-register.	002400	003000	003400
WRITE FILE MARK. Writes continuous file mark. Status bits 9 (FLAG) and 10 (WRITE) are set in the B-register.	042400	043000	043400
SEARCH. Selected deck is put into the SEARCH mode. Each file gap detected causes bit 13 to set. If computer is HALTED after giving the SEARCH command, the cassette will stop when it encounters the next file gap.	100400	101000	101400
REWIND. Rewinds cassette to BOT. When oxide is encountered, bit 12 will set.	020400	021000	021400
HALT. This command may be issued while tape is in motion. Bit 15 (ERROR STATUS) may be tested by halting in the middle of a character and then going to the READ mode.	010400	011000	011400
READ. Reads data in bits 0-7 of the B-register.	004400	005000	005400

## NOTE

In the READ mode, it is helpful to have cassette SRTD1 at hand. This is a tape recorded with all "1"s and no record gaps or file gaps.

SRTD1 may be created by running the Switch Register Diagnostic in the WRITE mode, and selecting switches 0-7 on the computer's switch register. When the tape reaches EOT, bit 12 (LEADER/OXIDE) will set. IMMEDIATELY HALT the computer.

*Table 5-4. 85001A Words*

## INPUT WORD (Input to computer from 85001A)

0	Data Read
1	Data Read
2	Data Read
3	Data Read
4	Data Read
5	Data Read

12	Halt Command
13	Rewind Command
14	File Mark Command
15	Search Command

## SECTION VI

### SERVICE DIAGRAM DESCRIPTION

#### GENERAL DESCRIPTION

The control word issued by the computer is buffered by the Computer Control Assembly (A6). The control word selects a deck and one function (for example, READ). It is ANDed with the command strobe to transfer control information to the rest of the 85001A.

Most of the control word is sent to the Motion Control Assembly (A5), which selects the READ or WRITE and DECK SELECT latches. The selected deck is put into motion by IMOT via one of the Deck Control Assemblies (A1, A2, or A3). If the photocell on the selected deck detects leader, BOT DELAY is enabled. This delay inhibits reading or writing until the tape is a few inches past the leader/oxide splice.

When IMOT is issued, UP TO SPEED DELAY is also enabled. This assures that the selected deck is up to speed before attempting to read or write.

The Deck Control Assemblies (A1, A2, A3) control the transports. This includes head position, rewind or forward motion, and brake. The Deck Control Assemblies also buffer the signal from the photocell and position switches on the transport. The position switches monitor the current physical state of the transport (head in or head out).

#### ON LINE WRITE MODE

Assume a WRITE control word has been issued by the computer. When the status lines indicate the 85001A is in the WRITE mode and a deck is selected (checked by software), the 8-bit data word is parallel strobed by NDATT\* into REG 1 on the Shift Register Assembly (A9). Because REG 2 contains no information during the first data transfer, the contents of REG 1 is immediately parallel strobed into REG 2 by the DATA TRANSFER STROBE.

REG 2 serially transfers the 8-data bits into the WRITE FLIP-FLOP on the Tape Data Control Assembly (A13). From there it is transferred to the WRITE AMPLIFIER on the Read/Write Electronics Assembly (A15). The data is clocked out of REG 2 by the 5 kHz\*\* TAPE CLOCK on A13. This clock complements the WRITE FLIP-FLOP at the beginning of the first eight cell times. This is explained in the discussion of the DIPHASE RECORDING TECHNIQUE in the Maintenance Manual. The cell times are counted by CNTR 2 on the TTY Control Assembly (A12). When CNTR 2=8, the SEND DATA FLIP-FLOP sets, and REG 2 resets. This indicates that the 8 bit word has been transferred out of REG 2 and written on tape.

The TAKE DATA FLIP-FLOP is set by the WRITE COMMAND strobe (NDATT). The SEND DATA and TAKE DATA signals are ANDed to produce the DATA TRANSFER STROBE to empty the contents of REG 1 into REG 2.

This also sets the FLAG indicating REG 1 is ready for another word from the computer. CNTR 2 is reset at CNTR 2=11. A 3 bit cell time character gap is written on tape during the interval CNTR 2=8 to CNTR 2=11. The cycle is now repeated with a new 8 bit word being strobed into REG 1.

---

\*Signals NDATT, ODATT, and CMDT are generated by a computer STC.

\*\*This is a 10 kHz clock; however, only every other cycle is used to clock the WRITE sequence.

## ON LINE READ MODE

Assume a READ control word has been issued by the computer, and that the status lines indicate the 85001A is in the READ mode and a deck is selected.

As in the WRITE mode, signals IMOT, UP TO SPEED DELAY, and BOT DELAY are generated. The DECK SELECT signals are sent to the Read/Write Electronics Assembly (A15). There, one of the read preamplifiers is selected. Flux reversals on the tape generate an analog signal, which is sent to the Reproduce Amplifier Assembly (A14). Toggling of the BI-POLAR FLIP-FLOP generates a DATA READ CLOCK. The DATA READ CLOCK starts and clocks the read sequence.

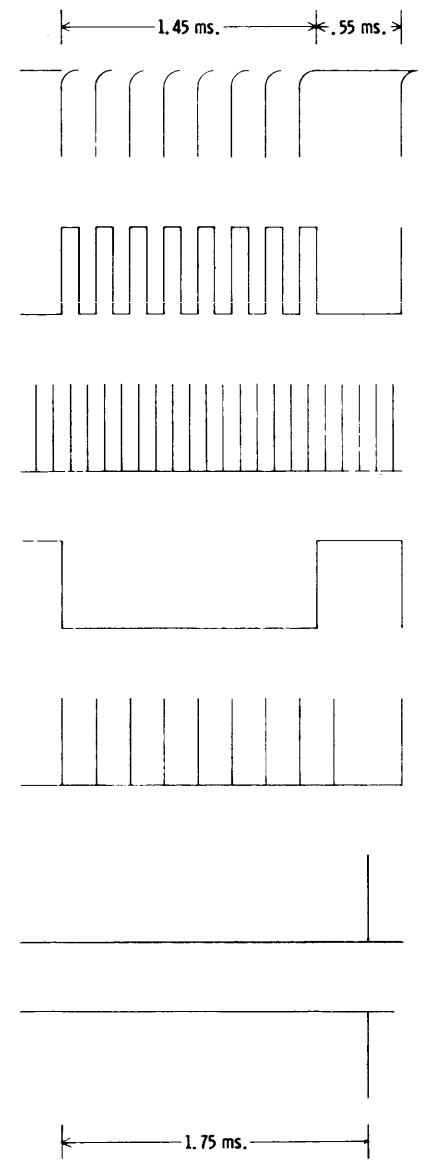

The DATA READ CLOCK generates a 135 usec delay called READ TAPE SHIFT. When this delay times out, REG 1 SHIFT is generated. This shifts data (0 or 1) from the BI-POLAR FLIP-FLOP into REG 1, causing all prior bits to shift up one place. REG 1 SHIFT also increments CNTR 1.

READ TAPE SHIFT is timed by two delays—GAP T1 (450 usec) and GAP T2 (1.1 msec). Each READ TAPE SHIFT starts these timers. If GAP T1 times out (indicating that READ TAPE SHIFT has been absent for 450 usec), then a character gap has been encountered. If this occurs, CNTR 1 is checked to verify eight bits have been assembled. If CNTR 1 does not equal 8, then ERROR FLAG is generated. ERROR FLAG is also generated if an odd number of flux reversals are detected. READ TAPE TAKE DATA SET, which is generated by GAP T1, sets the TAKE DATA FLIP-FLOP. TAKE DATA is ANDed with SEND DATA to produce the DATA TRANSFER STROBE. This strobe parallel transfers the contents of REG 1 into REG 2. It also causes REG 1 to reset, SEND DATA to reset, the FLAGS latch to set, and the TAKE DATA FLIP-FLOP to reset.

The computer senses if REG 2 is ready to transmit a character by examining the flag status line (FLAGS). When it detects FLAGS, the computer generates ODATT. This resets the FLAGS latch and CNTR 2. The next character is then shifted into REG 1 to repeat the cycle.

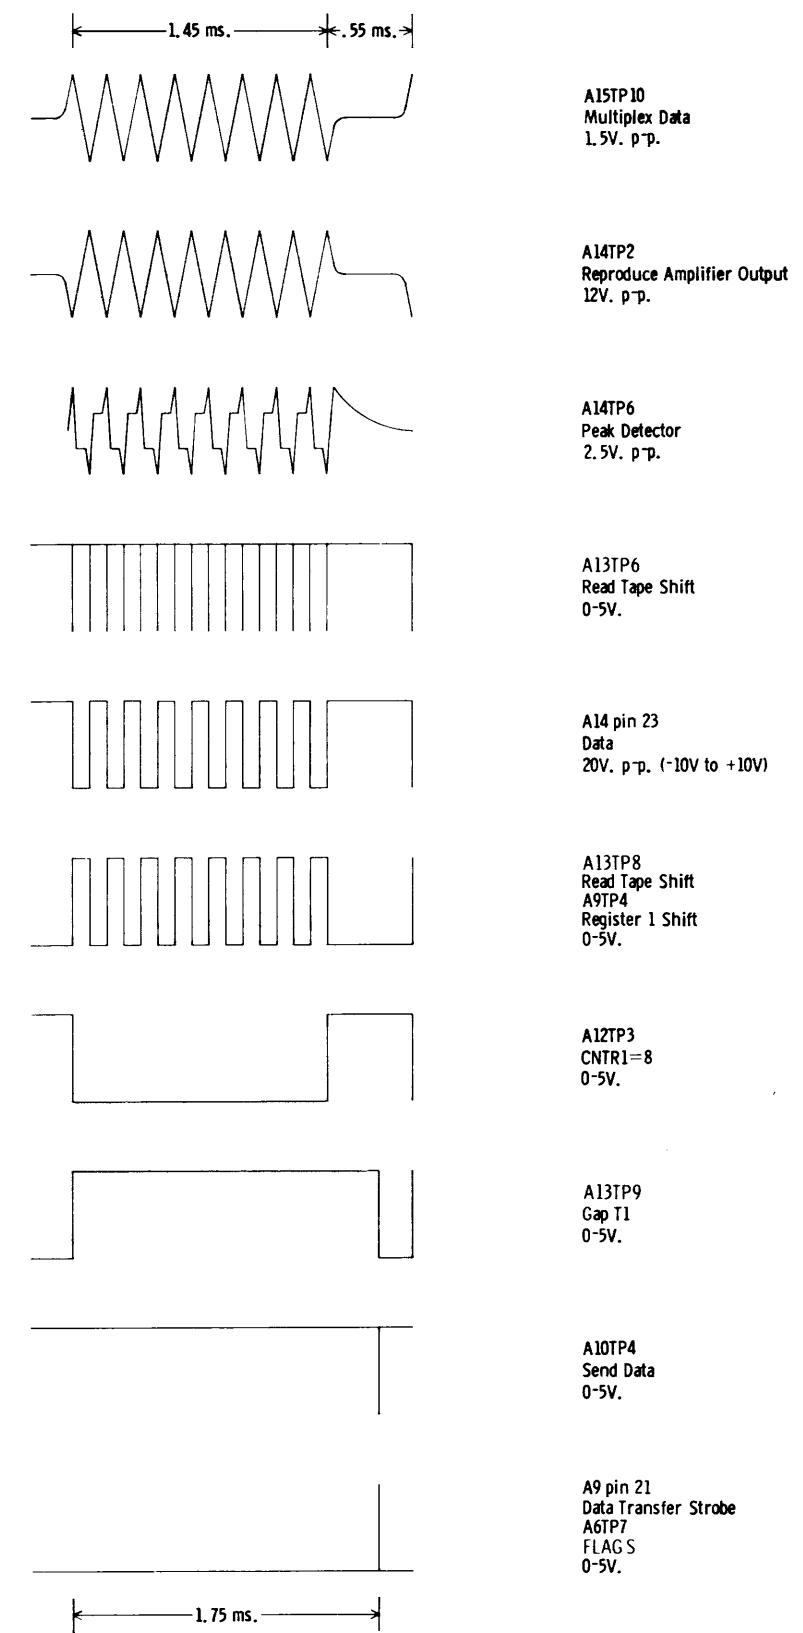

## SEARCH MODE

In the SEARCH mode, the SEARCH latch on the Computer Control Assembly (A6) is set. When this latch is set, the GAP T2 times out (indicating that a gap longer than a character gap has been detected), the FILE GAP DETECT latch will time for 50 ms. At the end of this time, FLMKS will be presented to the computer, indicating that a FILE MARK has been detected. The 85001A halts in the first record gap following the file gap.

## **SECTION VII REPLACEABLE PARTS**

### **INTRODUCTION**

This section contains information for ordering replaceable parts. Table 7-2 is the list of replaceable parts. Table 7-3 contains the names and addresses that correspond to the manufacturer's code numbers.

#### **NOTE**

In an effort to make this parts list easy to use for people already familiar with Hewlett-Packard's nomenclature and parts list format, all integrated circuits from DICOM's schematic diagrams are changed from "A" to the more conventional "U".

### **TABLE OF REPLACEABLE PARTS**

The table of replaceable parts is organized as follows:

- a. Electrical assemblies and their component parts in alpha-numeric order by reference designation.
- b. Chassis parts in alpha-numeric order by reference designation.
- c. Miscellaneous parts.

The information given for each part is as follows:

- a. The Hewlett-Packard part number.
- b. Total Quantity (TQ) in the instrument. Total quantity is given only once—at the first appearance of the part number.
- c. Description of the part.
- d. Typical manufacturer of the part, in a five-digit code.
- e. The manufacturer's number for the part.

**ORDERING INFORMATION**

To order a part listed in the replaceable parts table, quote the Hewlett-Packard part number, indicate the quantity required, and address the order to the nearest Hewlett-Packard office.

To order a part that is not listed in the replaceable parts table, include the instrument model number, instrument serial number, the description and function of the part, and number of parts required. Address the order to the nearest Hewlett-Packard office.

**APPENDIX A TEST POINTS**

Table A-1. Test Points (1 of 4)

Test Point	Signal Name	Signal Function	Conditions Set For Signal Description	Signal Description	Malfunction Symptom	Troubleshooting
A1TP2 A1TP2 A3TP2	RAISE HEADS	Activates heads-out solenoid.	1. Heads in or out. 2. Heads in motion.	1. +28V. 2. +.2V.	Heads do not pull away from cassette, cannot eject.	
A1TP3 A1TP3 A3TP3	REWIND SOLE-NOID	Activates rewind solenoid.	1. Rewind. 2. No rewind	1. +.2V. 2. +28V.	Cassette will not rewind	With no cassette in deck and loader down, grounding TP3 will activate solenoid.
A1TP4 A2TP4 A3TP4	LOWER HEADS	Activates heads-in solenoid.	1. Heads in or out 2. Heads in motion	1. +28V. 2. +.2V	Heads do not come in.	
A1TP5 A2TP5 A3TP5	RAISE LOADER	Activates loader solenoid.	1. Loader up or down. 2. Loader in motion.	2. +28. 2. +.2V	Loader will not raise. Cannot eject cassette.	
A1TP6 A1TP6 A3TP6	BOT PHOTO-CELL IN	Detects if tape is on clear loader.	1. Tape on clear loader. 2. Tape on oxide.	1. +5V. 2. OV.	Cannot eject cassette, read or write.	Check photocell and photocell lamp.
A1TP7 A2TP7 A3TP7	TACH A	Detects tape motion.	Tape motion.	Sawtooth Amplitude 0 to .5V.	No tape motion.	
A1TP8 A2TP8 A3TP8	RE-WIND LATCH	Indicates deck in rewind mode.	1. Rewind selected. 2. No rewind.	1. +5V 2. OV	Cannot rewind.	
A1TP9 A2TP9 A3TP9	DECK SELECT	Indicates deck selected.	1. Deck selected. 2. Deck not selected.	1. +5V 2. OV	No motion.	
A1TP10 A2TP10 A3TP10	READY LATCH	Indicates deck ready.	1. Any condition except rewind. 2. Rewind.	1. OV 2. +5V	Deck will not go ready	
A1TP11 A2TP11 A3TP11	WRITE LATCH	Indicates deck in write mode.	1. Deck in write mode. 2. Not write.	1. +5V 2. OV	Cannot write.	
A1TP12 A1TP12 A3TP12	HIPS*	Heads-in-place latch.	Heads in.	+5V	Deck control problems.	
A1TP13 A2TP13 A3TP13	BRAKE	Controls tape.	1. Capstan halted. 2. Read or write.	1. +1V. 2. +28V.	Cannot stop or start motion.	
A4TP2	RWNPD*	Indicates re-wind cycle.	Rewind pushbutton and halt pushbutton in.	OV	Cannot select rewind from front panel.	
A4TP4	ON LINE	Selects ON LINE or OFF LINE operation.	1. ON LINE 2. OFF LINE	1. +5V 2. OV	Cannot select ON LINE or OFF LINE from front panel.	

Table A-1. Test Points (2 of 4)

Test Point	Signal Name	Signal Function	Conditions Set For Signal Description	Signal Description	Malfunction Symptom	Troubleshooting
A4TP5	WRITP*	Selects write mode.	Write pushbutton and halt push-button in.	OV	Cannot select write mode from panel front.	
A4TP6	READP*	Selects read mode.	Read pushbutton and halt push-button in.	OV	Cannot select read mode from front panel.	
A5TP2	UP to SPEED	Indicates deck is in motion.		+5V	Cannot read or write.	
A5TP4	READ LATCH	Selects read mode.	Deck in read mode.	+5V	Read cannot be selected.	
A5TP5	UP to SPEED DLY LATCH	Indicates deck is motion.		OV	Cannot read or write.	
A5TP8	WRITE	Selects write mode.	Deck in write mode.	+5V	Cannot read or write.	
A5TP9	BOT INH LATCH	Inhibits read or write near leader/oxide splice.	1. Beginning of tape. 2. At least 10 inches past splice.	1. +5V 2. OV	Cannot read or write.	
A6TP2	ERROS	Detects error.	No error detected.	OV	Error status line always set.	
A6TP3	FILE GAP DELAY	Timer for file gap detect latch.	1. Reading character gap. 2. Reading file gap.	1. Saw-tooth 0 to .6V 2. 1.2V	Cannot search or detect file mark.	
A6TP5	SRCH*	Indicates search mode.	Search mode selected.	OV	Cannot search or detect file gap.	
A6TP7	FLAGS	Indicates flag issued.	Reading or writing.	See Figures 7-1 and 7-2 for waveforms.	On line device is waiting for flag.	
A6TP9	DRDYS	Indicates deck ready	1. Deck ready (light on). 2. Deck in operation.	1. +5V 2. OV	On line device waits for deck to go ready.	
A9TP2	REG 2 RESET*	Resets REG 2.	Writing or reading	See A10TP5		
A9TP3	REG 2 SHIFT	Shifts data up one-place in REG.2	Writing character on tape.	See Figure 7-1 for waveform	Does not write.	
A9TP4	REG 1 SHIFT	Shifts data up one place in REG. 1.	Reading character from tape.	See Figure 7-1 for waveform	Does not read.	

Table A-1. Test Points (3 of 4)

Test Point	Signal Name	Signal Function	Conditions Set For Signal Description	Signal Description	Malfunction Symptom	Troubleshooting
A10TP2	SEND DATA RESET	Resets Send Data Flip-flop.	Read or write	See A6TP7	Does not read.	
A10TP3	SEND DATA	Sets Send Data Flip-flop.	1. Write. 2. Read.	1. See A10TP5 2. +5V	Does not read.	
A10TP4	SEND DATA		1. Reading. 2. Writing.	1. See Figure 7-2 for wave-form. 2. OV	Does not read.	
A10TP5	TAKE DATA	Indicates REG 1 ready to transfer data.	1. Writing 2. Reading	1. See Figure 7-1 for wave-form. 2. OV	Does not read.	
A12TP2	Counter 2 = 8	Indicates 8 bits have been written.	Writing character on tape.	See Figure 7-1 for wave-form.	Does not write.	
A12TP3	Counter 1 = 8	Indicates 8 bits have been read	Reading character on tape.	See Figure 7-2 for wave-form.	Does not read.	
A12TP7	FLAG ENABLE	Enables Flag latch.	Read or write.	OV	Flag is not sent to on-line device.	
A13TP4	WRITE 1	Sends "1" to write electronics.	Writing character on tape.	See Figure 7-1 for wave-form.	Does not write.	
A13TP6		Triggers tape read shift.	Reading character from tape.	See Figure 7-2 for wave-form.		
A13TP7	GAP T2	Detects record gap.	Reading record gap.		Does not read or search.	
A13TP8	READ TAPE SHIFT	Increments CNTR1 and CNTR2 and shifts REG 1.	Reading characters from tape.	See Figure 7-2 for wave-form.	Does not read or search.	
A13TP9	GAP T1	Detects character gap.	Reading characters from tape.	See Figure 7-2 for wave-form	Does not read or search.	

Table A-1. Test Points (4 of 4)

Test Point	Signal Name	Signal Function	Conditions Set For Signal Description	Signal Description	Malfunction Sympton	Troubleshooting
A13TP10	TAPE CLOCK	Clocks write sequence.	Writing characters on tape	See Figure 7-1 for wave-form.	Does not write.	
A14TP2		Output of reproduce amplifier	Reading character.	See Figure 7-2 for wave-form.	Does not read.	
A14TP4		Input to peak detector.	Reading character.		Does not read.	
A14TP6		Input to bi-polar flip-flop.	Reading character.	See Figure 7-2 for wave-form.	Does not read.	
A15TP2	WRITE HEAD 3	Write signal.	Writing character.		Transport motion and write mode indicated, but no character written.	
A15TP3	WRITE HEAD 3	Write signal.	Writing character.			
A15TP4	WRITE HEAD 3	Write signal.	Writing character.	OV.		
A15TP5	READ DATA 3	Read 3 preamplifier output.	Reading character.	See A15TP10		
A15TP6	WRITE HEAD 2	Write signal.	Writing character.	OV.		
A15TP7	READ	Read 2 preamplifier output.	Reading character	See A15TP10		
A15TP8	WRITE HEAD 1	Write signal.	Writing character.	OV.		
A15TP9	READ DATA 1	Read 1 preamplifier output.	Reading Character.	See A15TP10		
A15TP10	MPX DATA	Selected read preamplifier.	Reading character.	See Figure 7-2 for wave-form.	Cannot read.	
A15TP11	WRITE HEAD 3	Write signal to Head 3.	Writing character.	See Figure 7-1 for wave-form.	Transport motion and write mode indicated, but no character written.	
A15TP12	WRITE HEAD 3	Write signal to Head 3.	Writing character.	See A15TP11		

## APPENDIX B

### RESTORING THE PROTECTED BINARY CASSETTE LOADER

To load the 85001A Protected Binary Cassette Loader (PBCL) into the protected area of memory:

1. Load the following instructions through the switch register starting at address  $22_8$ :

(22)	064050	(40)	1037cc
(23)	014035	(41)	1023cc
(24)	001727	(42)	024041
(25)	070052	(43)	1025cc
(26)	014035	(44)	010047
(27)	030052	(45)	124035
		(46)	004400*
(30)	170001	(47)	000377
(31)	006004		
(32)	054051	(50)	0x7700
(33)	102077	(51)	mm0000
(34)	024023		
(35)	000000		
(36)	060046		
(37)	1026cc		

\*Change this number if you want to change the deck from which the PBCL will be read into core. Refer to Appendix C.

cc = I/O channel for the 85001A

x =	1 for 8K memory
	2 for 12 K memory
	3 for 16 K memory
	5 for 24K memory
	7 for 32K memory
mm =	02 for 8 K memory
	03 for 12K memory
	04 for 16 K memory

2. LOAD ADDRESS  $22_8$ .
3. Put the Bootloader Cassette into Deck 1 and position to the proper file (if necessary).
4. ENABLE the LOADER.
5. Press PRESET and then press RUN.
6. The computer should halt with a  $102077_8$  in the T-register. PBCL is now in protected core.

*Table B-1. Contents of PBCL*

	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>
0x7700	063767	106501	004010	002400	073727	017733	001727	003000
0x7710	073774	017733	073775	070001	037774	027722	017733	050001
0x7720	017742	102011	063775	043770	002021	102055	017733	000000
0x7730	044000	037775	027714	000000	017742	001727	073776	017742
0x7740	033776	127733	000000	063773	1026cc	1037cc	1023cc	027746
0x7750	1025cc	002020	102013	001222	002021	027761	1067cc	067771
0x7760	024001	001722	002020	027705	1025cc	013772	127742	173775
0x7770	1n0100	102077	000377	004400*	000000	000000	000000	000000

x = 1 for 8K  
           2 for 12K  
           3 for 16K  
           5 for 24K  
           7 for 32 K

cc = I/O channel for the 85001A Cassette Input/Output Unit

n = 6 for 8K  
       5 for 12K  
       4 for 16K  
       2 for 24K  
       0 for 32K

\*Modification of this instruction will result in altering the deck number from which the PBCL loads

005000 PBCL loads from Deck 2.  
 005400 PBCL loads from Deck 3.

## APPENDIX C

### CHANGING INPUT DECKS

#### **INPUTTING THE BOOTLOADER CASSETTE FROM ANOTHER DECK**

Use the following procedure to load PBCL from another deck:

1. Perform the procedure in Appendix B, but change the instruction in address 46 (octal) from the usual 004400 for Deck 1 to 005000 for Deck 2 or 005400 for Deck 3.
2. Load the PBCL through the selected deck.

#### **LOADING ABSOLUTE TAPES FROM ANOTHER DECK**

Use the following procedure to load absolute tapes from another deck:

1. ENABLE the LOADER switch.
2. Enter the appropriate "word" from Table C-1; select the "word" by core size of the computer and the number of the desired input deck. Load the "word" into core at the address shown (depending on the computer's core size).

*Table C-1. Changing Input Decks*

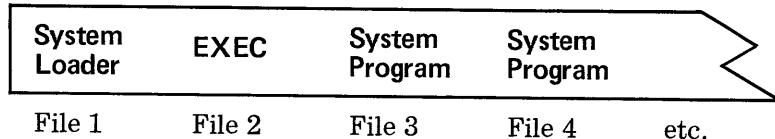

Core Size	Address	To load from	Deck 1	Deck 2	Deck 3
8K	017773		004400	005000	005400
12K	027773		same	same	same
16K	037773		same	same	same
24K	057773		same	same	same
32K	077773		same	same	same

3. PROTECT the LOADER

## APPENDIX D

### LOADING SYSTEM TAPES

A system tape is structured as follows:

The system tape must have the System Loader in the first file and the EXEC in the second file.

Use the following procedure to load the EXEC if the System Loader is not in core; if the System Loader is in core, skip to step 7.

1. Make sure all I/O peripherals are on.
2. Press HALT on the computer.
3. Insert the system tape into Deck 1 and ready the deck. Press ON LINE on the 85001A.
4. LOAD ADDRESS  $0x7700_8$ . ENABLE the LOADER.

x = 1 for 8K  
 2 for 12K  
 3 for 16K  
 5 for 24K  
 7 for 32K

5. Press PRESET and then press RUN. When the computer HALTs, the System Loader is in core and ready to run (it will halt with 102077 (octal) in the T-Register).
6. PROTECT the LOADER.
7. LOAD ADDRESS  $0x7500_8$  (x must be the same as x in step 4).
8. Press PRESET and then press RUN.

The System Loader will rewind Deck 1 to File 1, and then skip to File 2. It will then load and execute File 2. The print-out device will then print out EXEC >> and wait for a command (see Appendix F).

The EXEC may be restarted by loading address 100 (octal) and pressing RUN.

## APPENDIX E

### LOADING ABSOLUTE PROGRAMS WITHOUT THE EXEC

Use the following procedure to load an absolute program without the EXEC:

1. Insert the cassette into Deck 1. Press the loader down. The READY lamp above the deck will illuminate.
2. Select a file. If the program desired is stored in File 1, go to step 3. To select any other file, skip the preceding files by pressing OFF LINE and READ together (once for each file to be skipped). Both READ and HALT lamps will illuminate while skipping over the file, and just the HALT lamp will stay lit after each file is skipped.
3. Press ON LINE.
4. LOAD ADDRESS  $0x7700_8$ . ENABLE the LOADER.

x	=	1 for 8K
		2 for 12K
		3 for 16K
		5 for 24K
		7 for 32K

5. Press PRESET and then press RUN. When the computer HALTs, the program is in core (it will halt with 102077 (octal) in the T-Register).
6. PROTECT the LOADER.
7. To start running the program, LOAD ADDRESS the computer to the starting address of the program, press PRESET and then press RUN.

*Table E-1. Error Halts Loading Absolute Tapes*

Halt	Explanation
102011	Check sum error; check the tape for lint, dust, or other particles. Detected by computer.
102013	Tape error; check the tape for creases or ragged edges. Detected by <u>85001A</u> .
102055	Address error; check to be sure you used the proper tape. Detected by computer.

## APPENDIX F

### USING THE EXEC

The 85001A Executive (EXEC) provides operator control of the Cassette Operating System (COS). The hardware side of the COS consists of the computer and the 85001A Cassette Input/Output Unit. The EXEC is useful for troubleshooting because of its 85001A control capability. For example, the EXEC can be used to write ASCII characters on tape and then the characters can be read back to verify READ/WRITE operation. The EXEC may also be used to SEARCH, write FILE MARKS, etc.

Refer to Appendix D to load the EXEC into core. The EXEC provides commands to allow the operator to exercise the Cassette Operating System. Table F-1 describes the EXEC commands.

*Table F-1. EXEC Commands*

LIST F FROM A	<p>Lists ASCII characters from Deck A File F onto the print-out device; list stops at an End-of-File (EOF). Lift switch 0 on the computer's switch register to bail-out of the listing.</p> <p>If deck is not specified, the EXEC reads from Deck 2.</p> <p>If file is not specified, the EXEC reads from the next file on the specified deck.</p>
DUMP F FROM A	<p>Dumps binary data from Deck A File F onto the print-out device in octal format; dump stops at an End-of-File (EOF). Lift switch 0 on the computer's switch register to bail-out of the listing.</p> <p>If deck is not specified, the EXEC reads from Deck 2.</p> <p>If file is not specified, the EXEC reads from the next file on the specified deck.</p>
POS F ON A	<p>Positions the tape up to the beginning of File F on Deck A. If deck is not specified, the EXEC will position File F on Deck 2.</p>
WRITE F ON A	<p>Writes ASCII characters from the keyboard onto Deck A File F. After the WRITE command is given, type in the line to be inputted to the cassette; follow the line by typing a carriage return (CR).</p> <p>Type Control-C (C<sup>C</sup>) followed by a carriage return (CR) to bring the program back to EXEC&gt;&gt;.</p> <p>The EXEC will remind you to write an End-of-File (EOF). See WEOF.</p>
WEOF ON A	<p>Writes an End-of-File (EOF) mark on the current file in Deck A.</p> <p>See discussion of WEOF at the end of this table.</p>

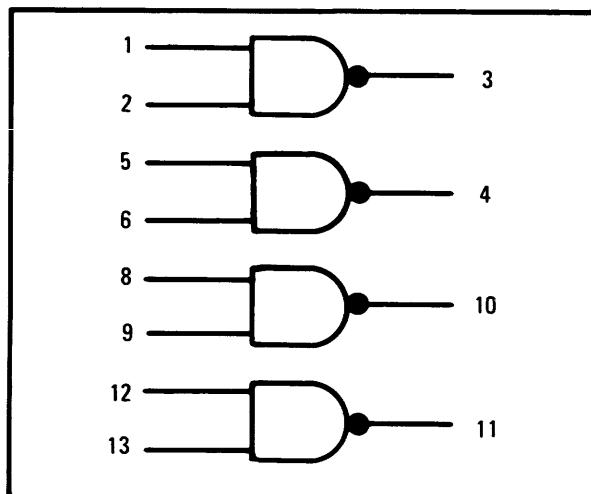

Table F-1. EXEC Commands (cont'd)

FILE F ON A	<p>Files a portion of the computer's core memory onto File F of Deck A. The deck must be specified. If the file is not specified, the EXEC will file on the next file on the specified deck.</p> <p>The data filed is in absolute format.</p> <p>After accepting the FILE command, the EXEC will ask:</p> <p style="text-align: center;">FIRST CORE LOC?</p> <p>Answer with the starting address of the portion of core to be filed. Answer in octal.</p> <p>If the number typed was an invalid number, the EXEC will respond with:</p> <p style="text-align: center;">INVALID COMMAND</p> <p>If answer was valid, the EXEC then asks for the octal address of the last location to be filed:</p> <p style="text-align: center;">LAST CORE LOC?</p> <p>If answer is valid, the EXEC files the portion of core selected. The EXEC then reminds you to write an End-of-File (EOF) mark by printing out:</p> <p style="text-align: center;">WEOF?EXEC</p> <p>If the answer to the LAST CORE LOC? was greater than the answer to the FIRST CORE LOC? question, the EXEC will print out:</p> <p style="text-align: center;">FIRST &gt; LAST</p> <p>and then will ask for the first core location again.</p>
LOAD F FROM A	<p>Loads File F on Deck A into core and begins executing the program contained in the file.</p> <p>The EXEC uses the System Loader to load the program into core memory. The System Loader assumes that the first record on the file to be loaded is the starting address of the program. The EXEC transfers program control to that starting address after loading.</p> <p>To return to the EXEC&gt;&gt; question, the EXEC must be re-loaded with the System Loader, unless the program just loaded has some feature for returning to the EXEC. All BCS-processed programs return to EXEC; to add the return feature to absolute programs, use the following coding:</p> <pre style="margin-left: 40px;">JMP SYSLD, I SYSLD OCT x7500 X = 1 for 8K     2 for 12K     3 for 16K</pre>
COPY N FROM A	<p>Copies N files from Deck A onto Deck 3. Deck A may be either 1 or 2 (but NOT 3); copies will always be written on Deck 3.</p> <p>Use a POS command to set the tape in position. Command COPY copies N number of files beginning with the current file on the specified deck.</p>

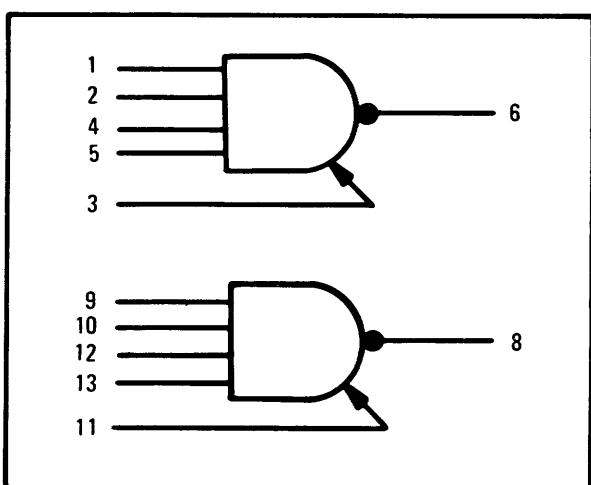

*Table F-1. EXEC Commands (cont'd)*

COPY N FROM A	COPY FROM A or COPY O FROM A causes the EXEC to copy only one file; the EXEC will not output an End-of-File (EOF) mark onto Deck 3 after the file has been copied, so COPY may be used to merge two files.
COMP N ON A	Compares N files on Deck A with N files on Deck 3. Use COMP to verify tapes after they have been copied.
SKIP N ON A	Skips N files on Deck A. If the deck is not specified, the EXEC will skip N files on Deck 2. The EXEC will return to the EXEC>> question if you command SKIP ON A or SKIP O on A.
EXEC	Loads the EXEC from File 2 of Deck 1 into core memory and then executes it. The EXEC responds to the command with EXEC>>. Answer with a command.
CLEAR	In a CRT-based system, CLEAR clears the screen and responds with EXEC>>. In a non-CRT-based system, CLEAR simply produces the EXEC>> question.
SYST	Lists the names of the programs on the current EXEC system tape. May be used to prepare a new system tape.
WEOF	Writes an End-of-File (EOF) mark after anything just written or filed. The EXEC does not automatically write the EOF mark because there may be times when it is desired to write or file data in several sections. For example, you may wish to write A and then go elsewhere to pick up B, and then file B behind A before writing the EOF mark.

## APPENDIX H

### 12849A INTERFACE CARD

The 12849A acts as an interface between the computer and the Cassette Input/Output Unit. The following modifications are made to the 12849A:

W1 to A is connected	W4 to B is connected
W2 to C is connected	W5 through W8 are removed
W2 to B is removed	W9 to A is connected.
W3 to B is connected	

The only difference between the presently used 12849A and the formerly used 12566A is a trace between MC85 Pin 1 and the I/O device connector Pin 21.

The cable between the 12849A Interface Card and the 85001A Cassette Input/Output Unit is HP Part No. 85001-60001. The wiring of this cable is shown in Table H-1.

*Table H-1. Cable Wiring*

## **APPENDIX I**

### **CLEANING THE TAPE PATH**

#### **HEAD AND BUFFER SPRING**

1. Lower the Loader Assembly.
2. Wet a cotton swab with Isopropyl Alcohol or Freon.
3. Insert the cotton swab into the loader opening and, using the EOT/BOT lamp as illumination, wipe off the Read/Write head (located to the rear and to the right of the lamp). Be careful not to bump the lamp.
4. Wipe off the Buffer Spring Assembly (the shiny metal object to the right and just inside the loader).
5. Wipe off the residue lying about in the Loader Assembly.

#### **PINCH ROLLER**

1. Remove the screws securing the top cover.
2. Remove top cover, and wet a cotton swab with water. Remove excess water.
3. Place the desired deck in OFF-LINE READ while holding the switch in the center of the Tape Transport Module clear plastic lid depressed.
4. Place the wetted cotton swab behind the rotating pinch roller.
5. Release the cassette in place switch and wipe off the capstan.

**CAUTION: DO NOT ALLOW THE COTTON SWAB TO BE  
PULLED INTO THE CAPSTAN.**

Supplement Part No. 85001-90033

PRINTED IN U.S.A.
