RTE-IVB QUICK REFERENCE GUIDE

DATA SYSTEMS DIVISION 11000 WOLFE ROAD CUPERTINO, CALIFORNIA 95014

PRINTING HISTORY

New editions are complete revisions of the manual. Update packages contain replacement pages or write-in instructions to be merged into the manual by the customer. Manuals will be reprinted as necessary to incorporate all prior updates. A reprinted manual is identical in content (but not in appearance) to the previous edition with all updates incorporated. No information is incorporated into a reprinting unless it appears as a prior update. The edition does not change.

First Edition	 	 Jan	1980
Second Edition	 	 July	1980

AB,optn

Abort currently executing batch job. Under session, the command is valid only when entered from the system console.

optn

0 Disc tracks not released.

1 Release all disc tracks.

AS,program,partition#

50

Assign a program to always execute in same partition. To unassign, set partition = 0.

BL

10

Examine current buffer limits

BL[,lower[,upper]]

60

Modify current buffer limits.

lower

Limit specified in number of words (default=0).

upper

Limit specified in number of words (default=existing

limit).

BR[,program]

10/60

Set break flag for any program in user's session. User programs tests for a set break flag with subfunction I=IFBRK (DUMMY). Required capability (Default=current session program.)

Set break flag in any program in the system. Requires capability of 60.

DN,,lu

60

Set I/O device down.

lu

system logical unit.

DN,eqt

60

Set I/O controller down.

eat

equipment table entry number.

EN, mstr scty code[,option]

__

Enable system console as a session terminal. Command only valid when entered from the system console.

mstr scty Two character FMP master security code.

option 0 master security code not required in "OP" com-

mands (default).

1 master security code is required in "OP"

commands.

EQ,eqt 10

Print description and status of an I/O controller. Status information is printed as.

select code DV.nn D B Unn status

select code is the I/O select code number.

DV.nn is the driver routine.

D is D if DMA required: 0 if not.

Unn is B if automatic output buffering; 0 if not.

status is the logical status:

GO[IH][,program][,pl[,...[,p5]]]]]

0 = available.

1 = I/O controller down.

2 = I/O controller busy.3 = waiting for DMA assignment.

UNbuffer

EQ,eqt, BUffer

60

30/60

Change the automatic buffering designation for a particular I/O device.

FL 10

Eliminate buffered output to a session terminal. Only valid in break mode, and not valid from system console.

mode, and not valid from system console.

Reschedule any program in users session, where parameters are passed by program only when it has suspended itself. GOIH inhibits passing of command string. Requires capability of 30.

Reschedule any program in the system. Requires capability of 60.

HE[,keyword[,lu]]

1

Detailed error explanation.

keyword an eight character error code (default=last error

logged).

lu device for explanation (default=user's terminal).

IT,program[,res,mpt[,hr,min[,sec[,tms]]]]

50

Set automatic execution time value for a program. ON command must follow to schedule the program. Not specifying optional parameters removes "program" from the timelist (program must be dormant).

res resolution code:

1 tens of ms 2 seconds 3 minutes 4 hours

mpt multiplier (0-4095) used with res.

hr.min Initial start time.

sec.tms

LU,lu

60

Print EQT entry number, device subchannel number, associated with a system lu, and whether the device is up or down. See SL command for similar function.

LU.lu.0

60

Reassign system lu to be bit bucket.

LU,lu,eqt[,subchannel #]

60

Reassign new EQT entry number to system lu. If EQT number has subchannels, use subchannel #.

OF,program[,numb]

30/60

Terminate a session program. Requires capability of 30.

Terminate any program in the system. Requires capability of 60.

numb 0 remove from time list; disc tracks not released (default).

1 terminate immediately; release disc tracks

8 terminate immediately and permanently from system (must be issued to segments as well as the main).

ON[IH],program[,NOW][,parameters]

50

Schedule a program for execution. Program's entry in time list is affected. ONIH inhibits passing of command string.

NOW Schedule program immediately.

parameters 1-5 parameters passed to program when it is

scheduled.

OP[,mstr scty code[,command]]

[__]

Enter a system level command from a low capability session. Command only valid when entered from the system console.

mstr scty Two character FMP master security code. If specified in the "EN" command the security code is

required.

command The system command to be executed.

PR,program,priority

50

Change program priority where priority = 1-32767 (decimal).

QU[,quantum[,limit]]

10/60

Examine system timeslice quantum and fence. Requires capability of 10.

Modify system timeslice quantum and fence. Requires capability of 60.

quantum system timeslice quantum, value 0-32767 millisecs

(default=1500).

limit priority level fence to begin timeslicing (default=50).

RS

10

Abort and reschedule a session's copy of FMGR.

RT,program

30

Release all disc tracks assigned to a program.

RU[IH],program[,parameters]

30

Schedule a program for immediate execution. Program's entry in time list is not affected. 1-5 parameters are optionally passed to program when it is scheduled. RUIH inhibits saving of command string. The breakmode RU actually runs "program" not a renamed copy of "program".

SL[,lu]

10

Display session lu information.

session lu for which linkage information is desired. (Default=information for all session lu's in user's

session switch table.)

SS[,program]

30/60

Suspend non-dormant session program. Requires capability of 30. If program name not specified, the current session program is suspended.

Suspend non-dormant system program. Requires capability of 60.

ST.name

10

Determine status of named program. Status is printed as:

pr S res mpt hr min sec ms T

pr

Decimal priority.

S

current state of program:

0 Dormant 1 Scheduled

2 I/O suspend

3 General wait

4 Unavailable memory suspend

5 Disc allocation suspend

6 SS or EXEC 7 suspend

9 Background segment

res/mpt/

0 or

hr/min/sec

time program is next scheduled to run.

/tms T

Program currently in time list.

ST[.numb]

10

Determine name or partition number of program currently executing.

numb

0 - Display name and partition number of program currently executing in memory. 0 displayed if none executing.

Partition # — Display name of program currently residing in that partition. 0 if none.

SZ,program

30

Display the named program's size information as follows:

AAAAA BB CCCC DD

AAAAA last word plus 1 of program.

BB required partition size. Program code + EMA.

CCCC EMA size (EMA programs only).

DD MSEG size (EMA programs only).

SZ,program,size[,MSEG size]

30

Change size of "program".

program program name.

size Non-EMA program: required program size.

EMA program: required EMA size.

MSEG size new MSEG size (EMA program only).

TE,message

10

Send message to system console.

ΤI

10

Print current year, Julian day and time.

TM,year,day[,hr[,min[,sec]]

60

Set real time clock.

year four digits (e.g., 1957).

day three digits Julian date (e.g., 063 = March 4).

TO,eqt[,numb]

10/60

Examine device time out parameters. Requires capability of 10.

Change device time out parameters. Where numb is number of 10 ms intervals used as new time out value. Requires capability of 60.

UP,eqt 10

Make I/O controller (and all associated lu's) available.

UR,partition # 50

Release reserved partition.

WH[,lu[,option]]

or ______10

WH[,option]

Schedule WHZAT program.

lu the session lu for display. (default=user's terminal).

option default User's session programs.

AL Display status of all suspended and sched-

uled programs.

SM Similar to AL except, state 3 programs without father son relationships are not listed.

PA Display status of all partitions.

PARAMETERS

namr=name[:security[:cartridge

[:type[:file size[:record size]]]]]

0

namr=logical unit number

security <0 Write and read protected

0 Not protected (default)

>0 Write protected

cartridge <0 lu number

0 First available cartridge (default)>0 FMGR cartridge reference number

file type 0 Non-disc file

1 128-word record length, random access

2 User selected record length, random access

3 (and greater) variable record length, sequential

access

4 Source program 5 Relocatable program

6 RTE load module

7 Absolute program >7 User defined

file size

Specified in blocks (2 sectors = 1 block = 128

words).

+n = allocate n blocks.

-n = allocate n 128 block multiples.

-1 = allocate remaining space on cartridge.

record

Used only when file is type 2.

size

SCHEDULING FMGR

RU,FMGR[,namr[,list[,severity code[,log]]]]

namrFile name or lu containing command input.loglu of log device (default=input or LU1).

list lu of list device (default=LU1).

severity code Display commands and error codes.

O Display all commands and errors (default).

1 Display no commands, all errors.

2 Display no commands, no errors except those requiring response. Terminates job on serious

error.

3 Same as 2 except job not terminated.

4 Display no commands, no errors, and do not abort job.

FMGR

AC,crn[,P/G[,size[,id[,# dir. tracks]]]]

10

Allocate a cartridge to the session user from the spare cartridge pool,

crn Cartridge reference number to be assigned to the

allocated cartridge.

P/G Private (P) or group (G) cartridge designation

(default=P).

size Number of tracks needed on cartridge.

id ASCII identifier of cartridge (default=DC00XX;XX is

system lu number of terminal).

#dir. # of tracks used by file directory (default=1).

tracks

AN, message

20

Print message on list device.

CA,global#[,pl[opl,p2[...,op(n),p(n+1)]]]

40

Calculate global parameter values.

global# Integer preceding G in G-type global, or "integer:P"

for P-type globals.

pl-pn Values used in calculations; if omitted, global is

nulled.

opl-opn Operations performed on operands pl-pn.

+ add two operands

- subtract second operand from first

/ divide second operand by first

multiply two operands

OOR

X XOR (exclusive OR)

A AND

CL[AL]

10

Display list of user accessible cartridges.

AL Display list of all cartridges in system.

CN[,namr[,function[,subfnctn]]]

20

Issue control request to non-disc device.

namr

Type 0 file name or lu (default=LU8).

function Control code, mnemonic (for octal see EXEC 3 call).

mnemonic

RW rewind (default=MT,CTU)

EΟ end-of-file

TÓ top-of-form (default=LP,CRT)

FF forward space file BF backspace file

FR forward space record

BR backspace record LE leader (default=paper tape punch)

lines on terminal.

subfnctn Carriage control.

> +n to space n lines before next print operation.

page eject on line printer or space -n -n

CO,cartridge1,cartridge2

20

Copy all files from active cartridge 1 to active cartridge 2.

CR.namr

20

Create a disc file — data not transferred, namr subparameters required:

> file type (must not be 0). file size (must not be 0). record size (when type=2).

REad ,BSpace,EOf .Blnarv CR,namr,lu,WRite,FSpace,LEader,AScii BOth .BOth .PAge ,cntrl .cntrl

20

Create a non-disc (type 0) file — data not transferred.

File name, security code, and crn. namr lu Lu of non-disc device (positive).

RFad

WRite Legal input/output (no default).

BOth

BSpace

Legal spacing (default=FS for READ devices, no **FSpace** BOth

space all others).

EOf

LEader Control subfunction (default=EO for mass storage PAge devices, LE for paper tape punch, PA for line

cntri printer).

Blnary **AScii**

Type of data (default=AS).

cntri

CS.lu.attribute

Modify or change spool options set up by SL command.

Lu defined at set up. hı

attribute One of the following:

> RWind reset file to first record PUrge change SAve flag to PUrge SAve change PUrge flag to SAve

PAss remove HOld option

write EOF and terminate spool. Spool file ENd placed in outspool queue (default).

BUffer change to buffering NBuffer change to no buffering

NPass change lu and/or priority information, by

specifying the 2 additional parameters:

[,outlu[,priority]] outlu = new lu.

priority = new priority.

CT,name[,function[,subfnctn[,message]]]

20

Issue control request to terminal.

name Type 0 file or terminal lu number.

function/ Octal code:

subfnctn 11B Space down a specified number of lines.

subfunction:

0 skip 2 lines. +n skip n lines. -n skip n lines.

20B Enable terminal (default)

21B Disable terminal

22B Set time out. Subfunction: value in units of 10

msecs.

message Message to be written to terminal.

DC,cartridge[,RR]

10

Logically remove a cartridge from session user's environment by setting inactive bit in session control block. Non-session, deletes entry in system cartridge list.

cartridge Positive cartridge reference number or negative lu.

RR Session only — deletes cartridge entry in system

cartridge list.

[,cartridge[,security]]

DL or .namr[.security]

namr

10

List the file directory of one or all of the mounted cartridges.

cartridge Cartridge reference number, positive for label or

negative for lu. Zero or none specified lists all.

Mask specifying the file entries in the directory to be output. Minus signs (–) can be used as place hold-

ers for more flexibility.

security Two-character FMP master security code.

If the master security code is 0, default in command will not obtain long list showing security codes — a code (any code) must be supplied.

DP[,p1[,p2[,p3...[,pn]]]]

20

Display parameter value or global names. pl-pn are parameters to be displayed

DU,namr1,namr2[,record format[,file#[,#files]]] 20

Transfer data from an existing file or lu to another existing file or lu. Does not create namr2.

Source of data namr1 Destination of data namr2

Format of data or EOF control (default=namr1 forrecord

format mat, or ASCII if non-disc device).

> ASCII records. ASCII

BReloc Binary relocatable records with

checksum.

Binary records without checksum. BNary Binary absolute records with checksum. BAbs

Magnetic tape ASCII records. MTape

MS

Magnetic tape SIO (System Input/ Output) records are written on namr2. Standard records are expected on

namr1.

Magnetic tape SIO binary relocatable MSBR

records (same as MS+BR).

Magnetic tape SIO binary absolute MSBA

records (same as MS+BA).

Inhibits EOF on namr2 and leader **IHibit**

punchina.

Save embedded EOF's in namr1. SAve File or subfile on namr2 where transfer starts

(default=1).

Number of files to be transferred from namr1 #files

(default=1).

FX

file#

Terminate FMGR.

SP [,RG[,KI]]

1

Initiate log-off process.

SP/RP Save/release private cartridges.

RG Release group cartridges.

Abort any active session programs. ΚI

HE[,keyword[,lu]]

1

Detailed error code explanation.

keyword Identifiers related to error code (session de-

fault=last error posted). Non-session, keyword must

be specified.

lu Device for explanation output (default=user's

terminal).

IF,p1,xx,p2[,skip]

40

Compare two values (usually globals) and skip a specified number of commands. Command not allowed from interactive device, must be in procedure file or batch job.

p1,p2 Values to be compared.

xx ASCII operators as follows:

EQ pl = p2NE pl = p2

LT pl < p2 GT pl > p2

GE pl≥ p2 LE pl≤ p2

skip Number of commands to skip (positive or negative).

Use -2 to skip back to previous command

(default=1).

IN,mstr scty code,crtrdge,lbl,id[,1st trk[,#dir trks[,#sec/trk[,bad trks]]]]

60

Initialize a cartridge.

mstr sec Two-character FMP master security code.

code

crtrdge Cartridge reference number, positive for label or

negative lu. (Must be -lu if new.)

New cartridge reference label and must be >0.

id Cartridge information label.

1st trk First track to be used on the cartridge. If LU2, must

be 8 greater than last system track (default=track

0).

#dir trks Number of directory tracks (1 to 48), (default=1).

#sec/trk Number of 64-word sectors per track. If LU2/3, pa-

rameter is ignored.

bad trks Bad track list. Up to six track numbers separated by

commas.

FMGR

IN,master security code - - new security code

60

Change master security code. New code is separated from old code by two minus (-) signs.

LI,namr[,format[,ln1[,ln2]]]

10

List contents of a file or lu on list device.

format Specifies list format.

S Source (default for type 0,3,4 files).

B Binary (default for all other type files).

D Directory information only.

In1 Starting line.

In2 Ending line.

LL,namr

20

Change current assignment of list device, namr may be either file or lu number.

LO.lu

40

Change lu number of log device where lu is an interactive device.

MC,lu[,P/G[,size[,id[,#dir trks[,label]]]]]

10

Make an unmounted cartridge available for use.

lu Lu number of cartridge to be mounted, it must be in

user's session switch table.

P/G Private or group cartridge (session default=P) non-

session meaningless, but its space must be

provided.

size # of tracks needed on cartridge.

id ASCII identifier of cartridge (default DC00XX; XX is

system lu number of terminal).

#dir trks # of tracks used by the file directory (default=1).

Cartridge reference number to be assigned to the

cartridge.

label

ME[,namr[,clear]]

10

Display contents of user's message file.

namr File name or non-disc lu to receive messages (de-

fault=user's terminal).

clear 1 (clear message file).

0 (do not clear=default).

OF,program

30

Terminate program within caller's current session.

OF,program

60

Terminate any program within the system.

PA[,lu[,message]]

40

Suspend execution of the current job or procedure file, and transfer control to a specified device, and optionally print a message.

lu Lu to which control transfers (default=log device).

message 1-80 ASCII characters.

PK[,cartridge]

20

Recover tracks and directory entries assigned to purged files and close gaps between files.

cartridge Cartridge reference number, positive for label or

negative for lu (default=all user accessible

cartridges).

PU.namr

20

Remove a file and its extents from system.

RN,namr,nuname

20

Change a file name to a new name.

namr Existing file name and parameters.

nuname New name unique to the cartridge, namr subparam-

eters may not be changed.

RP,namr,program

30

Restore program file "namr" using the ID segment of "program".

RP,namr

30

Restore program file "namr", which must be a type 6 file on LU2/LU3.

RP,,program

30

Release "program's" ID segment where "program" is a program with its ID segment in memory.

RT,program

30

Release all disc tracks assigned to a dormant program.

RU,program:IH[,parameters]

30

Schedule "program" for immediate execution, inhibit automatic renaming feature.

RU[IH],program[,parameters]

30

Schedule "program" for immediate execution. IH inhibits passing of command string.

program

Name of program to be executed or namr of type 6 file containing program or procedure file to be

executed.

parameters

1-5 parameters to be passed to program or 1-9

parameters passed to a procedure file.

SE[,p1[,p2[,...[p9]]]

40

Set or clear global parameters 1G-9G where p1-p9 are values to be converted to global parameters. If all parameters omitted, globals are nulled. If any one parameter omitted, corresponding global unchanged.

SL[,lu]

10

Display linkage information for session logical unit number.

lu

Session logical unit number (default=list information for all session lu's in user's Session Switch Table).

SL,lu[,namr[,attribute[,outlu[,priority[,prog]]]]] [

30/50

Spool setup and outspool control.

Iu The session lu to which a spool file is to be associ-

ated. The lu must not be LU2 (system disc), LU3 (auxiliary disc), any lu associated with a disc driver, a spool lu, or if in a job system LU5 (standard spool

input device).

namr Name of existing file to be used as a spool file

(default=system assigns spool pool file).

attribute Defines characteristics of spool access. Any 3 attri-

bute codes can be combined, no delimiters

necessary.

attribute codes:

NO = Queue file for immediate outspool.

RE = Read only. WR = Write only.

BO = Both read and write.

WN_= Write now.

BU = Buffered.

PU = Purge.

SH = Write spool headers.

ST = Standard file format.

default for attribute codes:

outlu outlu not specified specified

WRITE.HOLD. WRITE.HOLD. namr specified SPOOL SPOOL HEADERS. HEADERS. SAVE PURGE WRITE.HOLD. BOTH.HOLD. namr not SPOOL STANDARD specified HEADERS. FORMAT, SPOOL SPOOL POOL POOL FILE FILE

priority Outspool priority (default=session --- 99, batch ---

priority of job).

prog If specified, program "prog" will be scheduled, with

wait, by the spool system when spool lu is closed. Note the spool file will not be outspooled, "prog" must properly dispose of the file. Requires capability

of 50.

outlu Session lu for outspooling.

SL,session lu,system lu

30/50

Map a new session lu to system lu currently in the user's Session Switch Table. Requires capability of 30.

Add a System lu to user's Session Switch Table. Requires capability of 50.

System lu

May be specified as — (a dash) to delete lu mappings which have been created during user's session.

SM,user,namr,message

10

Send message and/or file to another user's message file.

user

Log on ID of message recipient, (user.group).

namr Name of file or non-disc lu containing data to be

sent.

message

String entered from sender's terminal.

,PR **SP**,namr[or [,capability]] ,GR

30

Place a disc resident program and its ID segment in a type 6 file created by this command. Note that namr can not be an lu. First 5 characters of file name must be identical to disc program name. namr subparameters default to:

security 0 cartridge -2 file type type 6

file size size of program

record size 128

ST,namr1,namr2[,record format[,eof] [,file #[,#files]]]

20

Transfer data from an existing file or lu to another file or lu. namr2 created by this command.

namr1 Source of data.

namr2 Destination of data.

record Format of data or EOF control (default=namr1 for-

format mat or ASCII if non-disc device).

ASCII ASCII records.

BReloc Binary relocatable records with

checksum.

BNary Binary records without checksum.

BAbs Binary absolute records with checksum.

MTape Magnetic tape ASCII records.

MS Magnetic tape SIO (System Input/
Output) records are expected on namr1.

Standard records are written on namr2.

MSBR Magnetic tape SIO binary relocatable

records (same as MS+BR).

eof Eof control.

file #

IHibit Inhibits EOF on namr2 and leader

punching.

SAve Save embedded EOF's in namr1.

File or subfile on namr1 where transfer starts (default=1).

#files Number of files to be transferred from namr1

(default=1).

SV,severity[,global #][,IH]

20

Change the system log device severity code to a new number.

severity 0 display all commands and errors (default).

1 display an commands, all errors,

2 display no commands, no errors except those requiring response. A serious error terminates job.

3 display same as 2, except job not terminated. 4 display no commands, no errors, job not

display no commands, no errors, job i terminated.

global # Optional G global number (1-9) into which current severity code is to be placed.

IH Optional parameter to inhibit echo of command

entry.

FMGR

1

Execute RTE system command from FMGR. Preface command by SY (use no delimiter, e.g., SYTI).

TE,message

10

Send message to the operator via the system console.

TR[,xfer[,parameters]]

1

Transfer control to a file or lu, passing parameters as globals.

xfer

A negative integer that denotes a transfer back that

many files, or the name of a file or lu.

parameters The parameters to be set into the globals (1G-9G).

Skipped parameters are not changed.

WH[,lu[,option]]

WH[.option]

10

Schedule WHZAT program.

lu

The session lu for display.

option

default User's session programs.

ΑL SM Display status of all the suspended and

scheduled programs.

Similar to AL except state 3 programs without father son relationships are not

BATCH AND SPOOLING COMMANDS

CONTENT AB	PAGE
AB	C-2
CS	C-2
EOJ	C-2
JOB	C-3
SL	C-3
RUN	C-5
TL	C-5
XE	C-5

BATCH AND SPOOLING

AB

30

Terminate batch job.

CS, lu, attribute

30

Modify or change spool options set up by SL command.

lu

lu defined at set up.

attribute

one of the following:

RWind

reset file to first record.

PUrae

change SAve flag to PUrge. change PUrge flag to SAve.

SAve

remove HOld option.

FNd

write EOF and terminate spool. Spool file

placed in outspool queue (default).

BUffer

change to buffering.

NBuffer NPass change to no buffering. change lu and/or priority information, by

specifying the 2 additional parameters:

[,outlu[,priority]]

[,outlu[,priority]]
outlu = new lu
priority = new priority

EOJ[,RP[,RG]]

30

End of spooled job.

RP

Dismount job's private session cartridges.

(Default=leave mounted.)

RG

Dismount job's group session cartridges.

(Default=leave mounted.)

JOB[,name[:hr:min:sec][,user[,priority[,spool priority][,sp]]]]

30

Initiate job for spooling.

name Job name.

CPU time limit for job in hours, minutes, seconds. :hr:min:sec

user Session user account ID in the form "user.group/ password". If a job is submitted outside of a session

when session is installed this parameter must be

specified.

Job priority in range from 1-255 (default = 99). priority

Outspool priority (default=priority). spool

priority

Specify: SD NO Outspool now, or NS

SL.lu[.namr[.attribute[.outlu[.priority[.prog]]]]] 30/50

Spool setup and outspool control.

The session lu to which a spool file is to be associlu ated. The lu must not be LU2 (system disc), LU3 (auxiliary disc), any lu associated with a disc driver, a spool lu, or if in a job system LU5 (standard spool

No outspooling.

input device).

BATCH AND SPOOLING

namr

name of existing file to be used as a spool file (de-

fault=system assigns spool pool file).

attribute

defines characteristics of spool access. Any 3 attribute codes can be combined, no delimiters necessary.

attribute codes:

NO = Queue file for immediate outspool

RE = Read only WR = Write only

BO = Both read and write

WN = Write now BU = Buffered

PU = Purge

SH = Write spool headers ST = Standard file format

default for attribute codes:

Outlin

	specified	specified
namr specified	WRITE,HOLD, SPOOL HEADERS, SAVE	WRITE,HOLD, SPOOL HEADERS, PURGE
namr not specified	WRITE,HOLD, SPOOL HEADERS, SPOOL POOL FILE	BOTH,HOLD, STANDARD FORMAT, SPOOL POOL FILE

outly not

priority

Outspool priority (default=session-99, Batch-priority of job).

prog

If specified, program "prog" will be scheduled, with wait, by the spool system when spool lu is closed. Note the spool file will not be outspooled, "prog" must properly dispose of the file. Required capability of 50.

ווא סו סנ

outlu Session lu for outspooling.

RUN, JOB, namr [, priority]

30

Run batch job.

namr

File name of file containing single job to be spooled, or logical unit of input device containing jobs to be spooled; (default=session terminal, or logical unit 5

if outside of session).

priority

Priority of job (default=99).

TL:hr:min:sec

30

Set run time limit.

:hr:min:sec Time limit for execution of any programs with RU command subsequent to TL command. If omitted,

job time limit is used.

XE,namr[,priority]

30

Job input control.

namr

Identifies input device containing a job to be placed in job queue, may be a logical unit or the name of an

existing file.

priority

Job priority (default=99).

GASP COMMANDS

CONTENT	PAGE
RU,GASP	
AB	
ω	
CS	
DJ	
DS	
EX	
KS	
RS	D-4
SD	D-5
SU	D-5
UP	D-5

RU,GASP[,lu]

Schedule GASP to prompt for command from lu (default=user's terminal).

RU, GASP, command

Schedule GASP, execute command, then terminate.

lu Logical unit of interactive device on which GASP

commands are entered. In a session environment lu must be specified if it is different from the session

logical unit.

command Any GASP operator command.

^AB,job # ,[u.g]

Before a job is processed, it may be removed with the AB command.

job # Number assigned to job by spool system; use DJ to

display job numbers.

u.g Aborts all jobs owned by session account (user.-

group).

,priority CJ,job #<,H >

Change job priority or status. Only used for a job in I, R, or RH status.

job # Number assigned to job by spool system; use DJ to

display job numbers.

priority New job priority; only allowed before job is active.

H Hold job from processing; changes R status to RH,

and I to IH.

R Release job for processing; changes RH status to R.

Change status of outspool file or change spool priority if outspool file is not active.

spoolfile Name of spool file as displayed by DJ.

priority New outspool priority.

H Hold spool file; if active, changes status to AH; if

waiting, changes status to H.

R Release spool file that has been held in AH or H

status.

^DA

Deallocate spooling. Before using DA, the spool system must be shut down, all files must be closed, and all current job processing and/or outspooling should be completed.

Only the system manager can execute this command.

Response:

KILL SPOOLING? The system prints this message in response to DA in order to give you a chance to change

your mind.

Display the job number, job name, job status, priority, user:group, and the spool pool files assigned to the job except for the job input spool.

AL Causes all jobs (session and non-session) to be

reported.

job # Job number of particular job to be displayed.

jobname Name of the job or jobs to be displayed.

If both job # and jobname are omitted, all jobs currently in the system for the current user are

displayed.

u.g Reports only jobs belonging to the user.group

account of u.g. If the '@' character is used for either the user or group, then all session users or groups

(or both) are reported.

^DS[AL][,lu[,u.g]]

Display the spool file name, job number, user.group name, outspool priority, spool status, and the logical unit to which the file is being or will be outspooled.

AL Causes all spools (session and non-session) to be

reported.

lu Outspool logical unit; only files directed to this lu are

displayed; if omitted, all files in the outspool queue are displayed. If in session, lu is the session lu, and the lu displayed is the system lu that the session lu

maps to.

u.g Reports only files belonging to the account of u.g. If

the '@' character is used for either the user or group, then all users or groups (or both) are reported.

^EX

lu

Terminate GASP.

Remove outspool file from the outspool queue.

spoolfile Name of spool file to be removed.

Logical unit of device to which file is being out-

spooled. When running under session, lu is the ses-

sion logical unit number.

u.g Kills all spool files owned by session account u.g.

^RS,spoolfile[,lu]

Restart active outspool file from the beginning.

spoolfile Name of active or active-held spool file in outspool

aueue.

lu New logical unit to which file is to be outspooled; if

omitted, logical unit previously assigned is used for

spool output.

Hold all spooled jobs, all spooled output, or both.

B Hold all pending jobs: spool files are not affected.

S Hold all pending spool files; job processing is not

affected.

none If both B and S are omitted, then both job processing

and outspooling are held. Inspooling by JOB may continue.

^SU<,B[ATCH] .S[POOL]>

Start up spool system after it has been shut down with SD.

B Jobs held with SD are released; does not restart

outspooling.

S Outspools held with SD are released; does not re-

start job processing.

none Both jobs and outspools held by SD are restarted.

^UP[,RS]

Up outspool device.

RS Restart active files from the beginning.

ACCOUNT COMMANDS

CONTENT	
EX	E-2
HE	E-2
LI	E-2
/A	E-2
TR	E-2
/E	E-2

ACCOUNT ID FORMAT

USER GROUP

@."group" - All users in group.

"user".@ - All users named "USER".

@.@ — All users.

EX[IT]

Terminate the account program.

HE[LP][,keyword[,list]]

List valid commands and scheduled HELP utility.

LI[ST],A[CCT][,<list namr>]

List session wide information.

LI(ST).G(ROUP).<group>[,<list namr>]

List one or more group account entries.

LI[ST],U[SER],<user.group>[,<list namr>]

Lists one or more user account entries.

TE[LL], <user.group>[<,namr>][, <MESSAGE>]

Send a message to a single active user or group, or to all active sessions.

/A

Abort current command.

[NO[ECHO]]]]

TR [,control[,list<

[EC[HO]]]]

Invoke a transfer from within a command.

/E

End current phase.

EDITR COMMANDS

SEARCH COMMANDS	F-4
EXCHANGE COMMANDS	F-4
TERMINATIONS	F-4

EDITR

RU,EDITR[,lu[,len]]

lu LU of interactive input device (default=user's

terminal).

ien Line length in characters (default=150).

EDITR RESPONSE

/source file?

POSSIBLE USER RESPONSES

Start edit with new, empty file.

: Abort EDITR immediately.

namr File to be copied to EDITR's work area.

{ } (blank) Current LS area copies to EDITR's work area.

EDITR prompt character "/" (default).

CONTROL COMMANDS

Xx Change prompt character to x.

CNTL/G Invoke or delete bell.

Tx Change tab control character, leave stops.

Txsl,...sn Set tab character to x and stops to sl...sn (de-

fault=";"7,21).

Wcoll.col2 Set window (column) boundaries (default=1,150).

#xxx start# Add the column identifier (xxx), and line sequence

increment# numbers.

=n Set line length to n (default=150).

K Kill trailing blanks

Mnamr Merge file "namr" after pending line.

DISPLAY COMMANDS

P Display and/or edit pending line.

Ln,[lu] List n lines on LU lu (default= pending and next

line).

n Display line n. make it pending line.

/n Advance pending line n lines.
+n Advance pending line n lines.

/n,[lu] Advance to line n displaying changed lines on lu.

+n,[lu] Advance to line n displaying changed lines on lu.

N Display pending line number.

ND Display line number of current line in destination

work area.

H Display number of characters in pending line.

HL Display header.

n Go back n lines in destination work area (default=1).

S Display approximate number of words in destination

file.

LINE EDITS

P Edit pending line then display it.

C Edit pending line then advance pending line.

O Duplicate pending line.

Replace pending line with "text".

Itext Insert "text" before pending line.

{ } text Insert "text" after pending line.

n Delete n lines (default=1).

CHARACTER EDITS

CNTL/R Replace characters.

CNTL/S Insert characters.

CNTL/S Cancel characters.

CNTL/T Truncate characters.

EDITR

SEARCH COMMANDS

First Field

Bfind field Find a line with "find field" from SOF to EOF.

Ffind field Find a line with "find field" from pending line to EOF.

Dfind field Delete lines from pending line to "find field".

Jfind field Jump to "find field" and make it pending line.

Find Field

":" Find field tabbed.

"esc" Find field of indefinite length.

"/" Find field within window.

"CNTL@" Find 0 length line.

EXCHANGE COMMANDS

Gold/new Character replace on pending line.

Yold/new Exchange on pending line, display next occurrence

of pattern.

Xold/new Enable exchange pattern over range of lines, with

range list

Vold/new Unconditional character replace, with list.

range

Uold/new Unconditional character replace, no list.

range

TERMINATIONS

A Abort, leaving source file unchanged.

ECnamr Create a FMGR file with edited version.

ER Replace old file with edited version.

ERnamr Replace existing file "namr" with edited version.

INTERACTIVE UTILITIES

	PAGE
Assembler	G-3

COMPL	G-3
FORTRAN	G-2
LOADR Commands	G-5
LOADR Operation	G-4
READT/WRITT	G-6

UTILITIES

FORTRAN AND ASSEMBLER

ASMB

RU, namr1[,namr2[,namr3[,lc[,cs]]]]

FTN4

namr1 Disc file or lu for source file.

namr2 Disc file, lu, or "-" for list. "-" creates file 'namr1 for

listing if namr1 begins with &.(default= user's

terminal).

namr3 Name of file or "-" for relocatable code. "-" creates

file %namr1 for relocatable code if namr1 begins

with &.(no default).

ic Line count per page.

cs Optional control statement which overrides the

source file control statement. Options are as follows:

FORTRAN

L Output source to list, namr2.

A Output Assembly listing to namr2.

T Output symbol table for each main or subprogram to list, namr2.

M Output a mixed listing of both the source and the object program to list, namr2.

C Output a cross reference symbol table listing to namr?

F Perform page eject.

D Compile debug lines.

n Error routine n supplied, n is a decimal digit 1-9 which specifies an error routine, ERRn.

Q Include the approximate relocatable address of each statement on the listing.

ASSEMBLER

- A Absolute assembly, the addresses generated by the assembler are interpreted as absolute locations in memory.
- R Relocatable assembly, the object program may be loaded anywhere in memory.
- L Output source listing to namr2. This includes both the opcode, and the address of the operand if it is a memory reference instruction.
- Q Output source listing to namr2. This includes only the operand address for single word memory reference instructions, otherwise the entire object code will be listed.
- T Output symbol table to list namr2.
- N,Z Selective assembly, sections of the program are to be included or excluded at assembly time depending upon the option specified.
- C Output a cross reference symbol table to namr2.
- F The floating point machine instructions are to be used instead of the software simulation routines for:
 - FIX.FLT.FDV,FMP,FAD,FSB.
- X No FAU hardware on machine.

COMPL AND CLOAD

COMPL

RU, ,namr1[,namr2[,namr3[,cs]]]

These utilities automatically invoke the appropriate compiler or assembler for a specified source file. CLOAD, in addition, schedules LOADR.

namr1 Name of source file.

namr2 Disc file, lu, or "-" for list file. "-" creates file 'namr1 for list file if namr1 begins with &. For CLOAD namr2

must be an lu. (default= user's terminal).

namr3 Name of file or "-" for relocatable code. "-" creates file %namr1 for relocatable code if namr1 begins

with &. (no default).

cs Optional control statement which overrides the

source file control statement.

UTILITIES

LOADR OPERATION

RU,LOADR[,command[,input[,list[,opcode [,format[,partn[,size]]]]]]]

command A command file namr, or input device lu. (default=

user's terminal or LU5 if batch).

input The file name of the relocatable main program or the

lu of the relocatable input. (no default).

list List lu, or file name namr. If a file name is specified,

the file must not already exist unless its' name begins with ('). (default= user's terminal or LU5 if

batch).

opcode Default = BGNCTE

BG Background program

RT Real time program

LB Large background program

SC System COMMON RC Reverse COMMON NC No COMMON

SS Use subsystem global (SSGA).

PE Permanent program.
TE Temporary program.

RP Replace permanent program (do not also specify PE).

format DB Append DBUGR subroutine to the program.

LE List entry points and base page links.

NL No listing desired.

DC Don't copy, multiple copies of the program are

not desired.

MP Use current page links, except for external references.

CP Use current page links, including external

references.
BP Use base page links only. (default).

The specific partition number in which program is to

be executed.

size Allows a logical address space larger than the pro-

gram size. Permits use of a dynamic buffer at the

end of the program.

partn

LOADR COMMANDS

SE Searches the system disc library for undefined

externals.

SE,namr Searches the file namr for undefined externals.

MS.namr Searches the file namr for undefined externals. The

file is searched multiple times to satisfy backward

references

RE.namr Loads file namr, which may be a program, sub-

routine, or segment.

LO.XXXXXB Changes the load address of the next module to be

relocated to the specified address.

LI,YYYY Set up file YYYY as a library file. Up to 10 files may

be specified.

SL Search all files specified in the library command.

TR.namr Go to file namr for succeeding LOADR commands.

Return to command file suspended when the unde-

fined external was encountered.

FO Force load a program or segment.

DI Print list of undefined externals.

EC Echo input commands on list device.*

EN EX

End of command input.

/E

TR

Abort the LOADR immediately.

AB /A

AS,XX Assigns the relocated program to partition XX.*

SZ.YY Allows a logical address space larger than the pro-

gram size. Permits the use of a dynamic buffer at the

end of the program.*

LL,namr Lu or file name for listing. If a file it must not already

exist, unless its name begins with (').*

OP.opcode Specifies an opcode parameter. See opcode sec-

tion of LOADR OPERATION.*

FM.format Specifies a format parameter, see format section of

LOADR OPERATION.*

*FOOTNOTE: Specification of the * commands must precede

specification of any RELOCATE, or SEARCH

command.

UTILITIES

SAVE DISC CARTRIDGE (WRITT)

RU,WRITT
$$\begin{bmatrix} ,-lu(c) & [,lu(m)] \\ ,+crn \end{bmatrix}$$

-lu(c) is the logical unit (LU) number of the cartridge to be

saved on mag tape.

+crn is the cartridge reference number (CRN) of the car-

tridge to be saved on mag tape.

lu(m) is the logical unit (LU) number of the mag tape unit

(default is LU 8). Either a positive or negative LU can

be specified.

RESTORE DISC CARTRIDGE (READT)

$${\sf RU,READT} \, \left[\begin{smallmatrix} ,-lu(c)\\ ,+crn \end{smallmatrix} \right] \left[\begin{smallmatrix} ,lu(m)\\ ,G \end{smallmatrix} \left[\begin{smallmatrix} ,P\\ ,Size \end{smallmatrix} \right] \right] \right]$$

-lu(c) is the logical unit (LU) number of the cartridge to

which the previously saved cartridge is to be

restored.

+crn is the cartridge reference number (CRN) of the car-

tridge being restored.

lu(m) is the logical unit (LU) number of the mag tape unit

(default is LU 8). Either a positive or negative LU can

be specified.

P designates that the cartridge is to be restored as a

private cartridge.

G designates that the cartridge is to be restored as a

group cartridge.

size is the desired size of the cartridge to which the mag

tape contents is to be restored. The size is specified in number of tracks (default is the size of the car-

tridge saved on the mag tape).

PARAMETERS

Parameters enclosed in [square] brackets are optional.

Parameters enclosed in <angle> brackets are optional in some cases and required in others.

Single underlined parameters have values returned by the system.

Double underlined parameters have values returned by the system in some cases, and user supplied in other cases.

I/O.READ/WRITE

EXEC

1,2,17,18,20

CALL EXEC (ICODE,ICNWD,IBFR,ILEN [,IPRM1][IPRM2],ICLAS)

ICODE 1 = READ

2 = WRITE

17 = Class READ 18 = Class WRITE

20 = Class WRITE/READ

ICNWD Control word, see I/O Control for format. If Z bit (12)

is set, an additional control buffer specified by IPRM1,IPRM2 is passed to the driver or to the pro-

gram doing the GET call.

IBFR Data buffer.

ILEN Data length (+ words, - chars).

IPRM1 Optional, or disc track number (for disc transfers), or

address of additional control buffer (if Z bit is set).

IPRM2 Optional, or disc sector (for disc transfers), or length

of additional control buffer (if Z bit is set).

Class number — required with Class I/O only.

ICLAS=0 to allocate a class number.

Returns

ICLAS

Normal I/O A = Status, EQT wd. 5 (if unbuffered device).

B = Transmission log (if unbuffered device).

Class I/O A = 0 — Request completed.

A = -1 — No class number (if no wait bit is set).

A = -2 — No memory or buffer limit exceeded (if no wait bit is set).

B = Meaningless.

I/O, CLASS GET EXEC 21

CALL EXEC (21,ICLAS,IBUFR,ILEN[,IP1][,IP2][,IP3])

*No Wait

IBUFR Data buffer.

ILEN Buffer length (+ words, - characters).

IP1 IPRM1 value returned from a class READ/WRITE or

CONTROL call.

IP2 IPRM2 value returned from a class READ/WRITE or

CONTROL call.

IP3 Returned value of original request code (ICODE).

1 = 17/20 (READ, WRITE/READ)

2 = 18 (WRITE)

3 = 19 CONTROL)

Returns

A-register If data, then A15 = 0 and A = status (EQT wd. 5).

If no data, and no wait bit is set, then A15 = 1 and A = -(numb + 1) where numb is number of requests made to class but not yet serviced by driver.

B-register If data, then B = transmission log (positive words or

characters depending on original request). If no

data, then B = meaningless.

10 = Immediate, no wait

23 = Queue, wait 24 = Queue, no wait

INAME Name of program or segment to be scheduled.

IPRM1- Up to 5 optional parameters passed to program

IPRM5 specified in INAME.

ILEN Length of buffer (+ words, - characters). Son re-

Buffer to pass to son. Not used for EXEC 8.

covers buffer using String Passage (ICODE = 14)

EXEC call. Not used for EXEC 8.

Returns

IBUFR

A-register 0 if schedule successful.

Program status if son not scheduled (immediate

schedule only).

If EXEC 8, the segment's ID segment address.

B-register Unchanged, or address of IPRM1-IPRM5 if they

were used.

STRING PASSAGE

EXEC

CALL EXEC (14,IRCOD,IBUFR,ILEN)

IRCOD Retrieve/write code:

1 Retrieve buffer or command string.

2 Write buffer to father.

IBUFR Buffer location.

ILEN Buffer length (+ words, - characters).

Returns

A-register 0 = successful; 1 = no string found.

B-register Transmission log.

STATUS, DEVICE

EXEC

1:

CALL EXEC (13,ICNWD,IST1[,IST2][,IST3])

ICNWD Lu of device.

IST1 Returned value of EQT word 5, see Device Status

table.

IST2 Returned value of EQT word 4, see EQT table.

Returned value specifying whether device is "up" or

"down".

Returns Meaningless.

IST3

STATUS, PARTITION

EXEC 25

CALL EXEC (25,IPART,IPAGE,IPNUM,ISTAT)

IPART Partition number.

IPAGE Returned value of starting page number.

IPNUM Returned value of the number of pages with base

page included (-1 returned if illegal partition

number).

ISTAT Return for partition status:

15 14 13 12 11 --- 7 --- 0

RS RT M S C-0-ID SEG NO.

RS = 1 if partition reserved RT = 1 if partition is real time

M = 1 if partition is mother

S = 1 if partition is subpartition

C = 1 if chain is in effect

Returns

A-register Meaningless.

B-register Unchanged.

MEMORY SIZE EXEC 26

CALL EXEC (26,IFAW,ILMEM,INPGS[,IMAP])

Returned value of first available word address after IFAW

program.

ILMEM Returned value, the number of words between end

of program and end of program's address space.

MPGS Returned value, number of pages in partition.

IMAP Returned value of user map (32 word array).

Returns

A-register Meaningless. B-register unchanged.

TIME REQUEST

EXEC

CALL EXEC (11,ITIME[,IYEAR])

ITIME Return for time value as follows:

ITIME (1) = 10's of milliseconds

ITIME (2) = Seconds ITIME (3) = Minutes

ITIME (4) = Hours

ITIME (5) = Julian day of year

IYEAR Returned value of year (e.g., 1975) (optional).

Returns

A-register Meaningless.

B-register Unchanged. TIMED EXECUTION EXEC (Absolute Start) 12

CALL EXEC (12,INAME,IRESL,IMULT, IHRS.IMIN.ISEC,IMSEC)

INAME Schedule INAME or if 0, schedule calling program.

IRESL Resolution code, see initial offset EXEC 12.

IMULT Execution multiple (set= 0 means run once).

IHRS

łRS γ

IMIN ISEC IMSEC

Defines absolute start time.

Returns

A-register Meaningless.

B-register Unchanged.

TIMED EXECUTION

EXEC

(Initial Offset)

CALL EXEC (12,INAME,IRESL,IMULT,IOFST)

INAME Schedule INAME or if 0, schedule calling program.

IRESL Resolution code.

1 = 10's/ms

2 = Seconds 3 = Minutes

4 = Hours

IMULT Execution multiple (set = 0 means run once).

IOFST Relative start time (negative value) from current time.

Returns

A-register. Meaningless.

B-register Unchanged.

TRACK ALLOCATION EXEC 4,15

CALL EXEC (ICODE, ITRAK, ISTRK, IDISC, ISECT)

ICODE

4 = local.15 = global.

J

ITRAK

Number of tracks.

B15 = 1 — Program not suspended if tracks not

available.

B15 = 0 — Program suspended if tracks not

available.

ISTRK

Returned value of starting track number (-1 if tracks

not available.)

IDISC

Returned value of disc lu, where tracks were

allocated

ISECT

Returned value of number of sectors per track.

Returns

Meaningless.

TRACK RELEASE

5.16

CALL EXEC (ICODE, ITRAK[, ISTRK][, IDISC])

ICODE

5 = local.

16 = global.

ITRAK

Number of tracks (If ICODE=5, then -1 = all tracks,

ISTRK and IDISC unnecessary.)

ISTRK

Starting track number.

IDISC

Disc lu.

Returns

Local.

A-register

Meaningless.

B-Register

Meaningless.

Returns

Global

. .

Status.

A-register

ialas.

0 = Tracks released.

U = TIACKS TELEASEU

-1 = No tracks released, one in use.
-2 = No tracks released, one not global.

B-register Meaningless.

LOGICAL UNIT LOCK PROGRAM CALL

CALL LURQ (IOPTN, LUARY, NOLU)

IOPTN Octal control word as follows:

0x0000 = Unlock specified lu's.

1x0000 = Unlock all lu's program currently has

locked.

0x0001 = Lock with wait specified lu's. 1x0001 = Lock without wait specified lu's. x(bit 14) is no abort bit; 1 = don't abort.

LUARY Array of lu's to be locked/unlocked. Ignored when

IOPTN = 1x0000.

NOLU Number of lu's to be locked/unlocked. Ignored when

IOPTN = 1x0000.

Returns

A-register 0 = Lock successful.

-1 = RN not available.

1 = lu already locked.

B-register Unchanged.

RESOURCE MANAGEMENT

CALL RNRQ (ICODE, IRN, ISTAT)

ICODE

Control word as follows:

Bits 15 no wait. 14 no Abort.

reserved for system use.

5 clear
4 global allocate option.

4 global 3 local 2 clear

1 global set option.

0 local

IRN

Resource number.

ISTAT

Status word.

0 = Normal deallocate return.

1 = RN is clear (unlocked).

2 = RN is locked locally to caller.

3 = RN is locked globally. 4 = No RN available now.

6 = RN locked locally to other program.

7 = RN was locked globally when request was made.

Returns

A-register Meaningless.

B-register Unchanged.

FMP CALLS

PARAMETERS

Parameters enclosed in [square] brackets are optional.

Parameters enclosed in <angle> brackets are optional in some cases and required in others.

Single underlined parameters have values returned by the system.

Double underlined parameters have values returned by the system in some cases, and user supplied in other cases.

NOTE: The FMP calls beginning with E (eg. ECREA) can define larger files, up to 32767x128 blocks. The FMP calls not beginning with E (eg. CREAT) can only define files up to 16383 blocks, and 32767 records.

IDCB A 144 word or longer, array used as the data control

block (DCB).

IERR Error return, see FMGR error codes for meaning. If

call is successful:

OPEN, OPENF IERR= file type.

CREAT IERR= number of sectors.

INAM Six ASCII characters. First character not a blank or number, no embedded blanks, and (+,-:) are not

allowed. All six placed must be accounted for, and a Fortran DATA statement can be used to specify

INAM.

IBUF User buffer.

ISC File security code:

<0 read/write protected. =0 not protected (default).

>0 write protected only.

ICR Cartridge reference:

>0 cartridge reference number.

<0 logical unit number.

=0 first one found (default). Order of search; private cartridges, then group cartridges, then

system cartridges.

IREC Next record number, double word for "E" type calls.

IOFF Block offset of next record.

IRB Relative block address of next record, double word

for "E" type calls.

IDCBS Actual size of DCB in words (only when IDCB >

144).

APOSN AND EAPOS

APOSN

CALL (IDCB, IERR, IREC<, IRB<, IOFF>>)

Position a disc file (typically type 3) to a known record address. Record addresses are usually obtained through LOCF for APOSN, and ELOCF for EAPOS. IRB and IOFF are required for files with variable length records.

CLOSE AND ECLOS

CLOSE

CALL (IDCB<,IERR>[,ITRUN])

ECLO

Close DCB and make file available to others, can also truncate file size.

ITRUN

One word variable for CLOSE, double word variable for ECLOS.

- +n number of blocks to be deleted from the end of the file when it is closed.
- -n retain main file, delete extents.
 - 0 standard close (default).

CREAT AND ECREA

CREAT

CALL

(IDCB,<u>IERR</u>,INAM,ISIZE,ITYPE REA [,ISC][,ICR][,IDCBS]<,JSIZE>)

Create a disc file.

ISIZE

Two entry array describing file size, for CREAT a two word array, for ECREA a double word integer for

each entry.

first entry — file size in blocks.

second entry - record length in words (used for

type 2 files only).

ITYPE

File type (1-32767).

JSIZE

Created file size in sectors; optional double word

parameter returned by ECREA only.

CRETS

CALL CRETS (IDCB,IERR,NUM,<u>INAM</u> [,ISIZE][,ITYPE][,ISC] [,ICR][,IDCBZ][,JSIZE])

CRETS creates a temporary or scratch disc file by making an entry in the File Directory and allocating disc space for the file. CRETS can define files up to 32767x128 blocks in size.

NUM Scratch file number, a one-word integer 0-99.

ISIZE A double word integer for each entry.

first entry — file size in blocks. second entry — record length in words (used for

type 2 files only).

ITYPE File type (1-32767).

JSIZE Created file size in sectors; optional double word

parameter returned if call was successful.

FCONT

CALL FCONT(IDCB,IERR,ICON1<,ICON2>)

Control I/O functions on a non-disc type 0 file.

ICON1 Control word, see EXEC 3 call for options.

ICON2 Additional control, see EXEC 3 call for options.

FSTAT

CALL FSTAT(<u>ISTAT[,ILEN][,IFORM][,IOP][,IADD]</u>)

Return status of mounted cartridges.

ISTAT Cartridge status buffer returned as FORMAT I or FORMAT II.

FORMAT I		
WORD	CONTENTS	CARTRIDGE
1	Logical Unit Number	First cartridge
2	Last FMP track	Ì
3	Cartridge Reference Number	•
4	Lock Word	
5	Logical Unit Number	Second cartridge
6	Last FMP track	1
7	Cartridge Reference Number	
8	Lock Word	
9	Logical Unit Number	
.	•	
.		
•	•	•
	0 no more discs	

where: Lock word is ID segment address of locking program or 0 (not locked).

	FORMAT II		
WORD	CONTENTS	CARTRIDGE	
1 2 3 4	Lock word Logical unit # Last FMP track Cartridge Reference Number ID	First cartridge	
5 6 7 8	Lock word Logical unit # Last FMP track Cartridge Reference Number ID	Second cartridge	
9 • •	Lock word Logical unit #	:	
	0 no more discs		

where: Lock word is the offset of the ID segment in the Keyword Table or 0 (not locked).

1D identifies who mounted the cartridge.

FMP CALLS

ILEN Length in words of status buffer (default= 125).

IFORM Zero for FORMAT I.

Non- zero for FORMAT II.

IOP Type of cartridges to return information about:

1 = all cartridges mounted to the system.

0 = (under session) all private, group, and system cartridges mounted to that session.

0 = (non session) mounted system and non session

cartridges.

IADD 0 if entire cartridge list was returned.

Non-zero if entire cartridge list could not be

returned.

IDCBS

ISIZE=IDCBS(IDCB)

Return actual DCB buffer area used (use only if IDCB > 144).

LOCF AND ELOCF

LOCF

CALL (IDCB, IERR, IREC[, IRB][, IOFF] ELOCF [, JSEC][, JLU][, JTY][, JREC])

Retrieve status and location information from the data control block on an open file.

JSEC File size in sectors; one word variable for LOCF.

double word variable for ELOCF.

JLU File lu.

JTY File type.

JREC Optional return for:

record length (type 1 or 2 files). read/write code (type 0 files). meaningless (type 3 and above).

NAMF

CALL NAMF(IDCB, IERR, INAM, MNAM[, ISC][, ICR])

Close the DCB, if open, and rename file INAM to MNAM.

OPEN AND OPENF

OPEN

CALL OPENF (IDCB, IERR, INAM

[,IOPTN][,ISC][,ICR][,IDCBS])

Open a file for access.

INAM

ASCII file name, or an integer containing a binary lu (OPENF only).

IOPTN

Open control word, defaults are:

- exclusive use, only the calling program can access the file.
- standard sequential output.
- file type defined at creation is used for access.

15 --- 11 10 9 8 7 6 5 4 3 2 1 0

E bit 0 exclusive open;

1 non exclusive open.

U bit 0 non update open;

1 update open.

T bit 0 file type defined at creation (disc only);

1 force file type to 1.

F bit 0 use function code defined at creation (type 0 files only);

1 use function code defined in bits 6-10 of IOPTN (for function codes see EXEC 3 call).

POSNT AND EAPOS

POSNT

CALL (IDCB,I<u>ERR</u>,NUR[,IR])

Position files relative to current file position or to a specific record number in any file type.

NUR

Record position, a one word variable for POSNT or

double word variable for EPOSN.

IR

Position mode flag, the relationship between NUR

and IR is:

NUR	IR = 0 OR OMITTED RELATIVE POSITION	IR ≠ 0 ABSOLUTE POSITION
NUR > 0	Position forward number of records specified	Position to record number specified
NUR = 0	No operation.	No operation
NUR < 0	Position backward number of records specified.	Error

POST

CALL POST(IDCB[,IERR])

Write contents of DCB to the disc, and save records in a file opened for non exclusive use. To lock the file for exclusive use with RNRQ call, use the following sequence:

- 1. call OPEN:
- 2. read file to pick up resource number;
- 3. call POST to clear DCB, no data is transferred;
- 4. call RNRQ to lock the file:
- 5. call READF to read the record to be modified:
- modify the record and call WRITF to write it out;
- 7. call POST to transfer the updated record;
- 8. call RNRQ to unlock the file.

PURGE

CALL PURGE(IDCB,IERR,INAM<,ICS><,ICR>)

Delete named file INAM and all its extents, the file must not be open.

READF AND EREAD

READF

CALL FREAD (IDCB,<u>IERR,IBUF</u>[,ILU][,<u>LEN]</u>[,NUM])

Read a record from an open file to the user buffer. If type 0 file, the number of words should be specified.

ILU Length of IBUF (read buffer), defaults are:

file type = 0 zero length record. file type = 1 128 word record. file type > 1 actual record length.

LEN Actual read length, set to −1 for EOF.

NUM A one-word variable (for READF), or double-word

variable (for EREAD) used to specify the record number to be read (default= start at current record

number).

RWNDF

CALL RWNDF(IDCB[,IERR])

Rewind a magnetic tape or position a disc file to the first record in the file

WRITF AND EWRIT

WRITE

CALL

(IDCB,<u>IERR</u>,IBUF[,IL][,NUM]) FWRIT

Write a record from the user's buffer to an open file. For type 0 or type 3 and above, a specified number of words is written. For type 1 and 2 files the exact record length is written.

IL Length of write buffer, defaults are:

file type = 0 zero length record. file type = 1 128 word record. file type = 2 actual record length. file type > 2 zero length record.

NUM Record number to be written. (default=start at cur-

rent record number).

SMP CALLS

CONTENT	PAGE
SPOPN	J-2
WORKING CALLS	
RETRIEVE RECORD POSITION	
CHANGE RECORD POSITION	

PARAMETERS

ISMP 3 word array containing name of program SMP.

ISLU Spool lu returned by SPOPN call. Each subsequent

spool call must specify this lu.

SPOPN

CALL SPOPN(IBUFR, ISLU)

Make a spool file active and ready for use.

IBUFR 16 word set up buffer structured as follows:

word contents

0 =0 if no batch input checking desired.

1 >0 session lu for the spool file; or

=0 SMP allocates a session lu for the spool

file; or

=1 a direct map to system lu is set up.

5 security code.

6 cartridge reference number.

7 driver type, in octal.

8 disposition flags:

BU 1= buffered; 0= not buffered.

BI 1= batch input: 0 otherwise:

W/R 10B= write; 01B= read; 00B= write/

ST 1= standard file; 0= spool file.

SP 1= spool pool file; 0= user file.

HO 1= hold outspool; 0= outspool now.

SA 1= save file: 0= purge.

9 spool priority (1-9999).

10 spoof status (used by SMP,GASP).

if batch — job number; if not batch — directory entry number of session program.

12-14 set to 0 or program parameter of SL command.

15 outspool lu.

ISLU Spool lu return.

WORKING CALLS

CALL EXEC(23,ISMP,XX,ISLU)

XX

- =1 Change purge to save.
- =2 Change save to purge.
- =3 Queue for outspooling.
- =4 EOF and queue for outspooling.
- =5 Change spool options; use additional parameters NOL and NPR following ISLU for this call only.
 - NOL new outspool lu (default=previous lu). NPR new outspool priority (default=previous value).
- =6 Set buffer flag.
- =7 Clear buffer flag.

RETRIEVE RECORD POSITION

CALL EXEC(23,ISMP,8,ISLU)

CALL RMPAR(IPRM) — for parameter pick up.

IPRM

5 word array containing pointers to record position.

word 1 =

contain an internal coding of the current word 2 =

position of the referenced file.

word 4 = not used but should be included in array. word 5 = not used but should be included in array.

CHANGE RECORD POSITION

CALL EXEC(23,ISMP,9,ISLU,IPRM1,IPRM2,IPRM3)

IPRM1-3 Record position from the RETRIEVE RECORD call.

LEGEND FOR EQT TABLE

R = reserved for system use.

I/O Request

 points to list of requests queued up on this EQT entry.

D = 1 if DCPC required.

B = 1 if automatic output buffering used.

P = 1 if driver is to process power fail.

S = 1 if driver is to process time-out.

T = 1 if device timed out (system sets to zero before each I/O request).

Subchan

= last subchannel addressed.

I/O Select Code = I/O select code for the I/O controller (lower number if a multi-board interface).

AV = I/O controller availability indicator:

0 = available for use.

1 = disabled (down).

2 = busy (currently in operation).

3 = waiting for an available DCPC channel.

Equipment Type Code = type of device on this controller. When this octal number is linked with "DVy," it identifies the device's software driver routine. Some standard driver numbers are:

00 to 07 = paper tape devices or consoles

00 = teleprinter or keyboard control device

01 = photoreader

02 = paper tape punch

05 = 264x-series terminals

07 = multi-point devices

LEGEND FOR EQT TABLE (CONTINUED)

10 to 17= unit record devices

10 = plotter

11 = card reader

12 = line printer

15 = mark sense card reader

20 to 37 = magnetic tape/mass storage devices

23 = 9-track magnetic tape

31 = 7900 moving head disc

32 = 7905/06/20 moving head disc

33 = flexible disc drives

36 = writable control store

37 = HPIB

40 to 77 = instruments

STATUS

= actual physical status or simulated status at the end of each operation (see Device Status Table).

CONWD

 combination of user control word and user request code word in the I/O EXEC call (see EQT wd. 6).

Letters in brackets (<>) indicate the nature of each data item as follows:

<A> = fixed at generation or reconfiguration time; never changes

 = fixed at generation or reconfiguration time; can be changed on-line

<C> = set up or modified at each I/O initialization

<D> = available as temporary storage by driver

<E> = can be set driver

<F> = maintained by system

^{* =} WORDS USED IN SHORT ID SEGMENTS

ID SEGMENT LEGEND

TM = temporary load (copy of ID segment is not on the disc)

ML = memory lock (program may not be swapped)

SS = short segment (indicates a nine-word segment)

TYPE = specified program type (1-5)

NA = no abort (instead, pass abort errors to program)

NP = no parameters allowed on reschedule

W = wait bit (waiting for program whose ID segment address is in word 2)

A = abort on next list entry for this program

O = operator suspend on next schedule attempt

LP = load in progress; program is being dispatched from disc.

R = resource save (save resources when setting dormant)

D = dormant bit (set dormant on next schedule attempt)

Status = current program status

T = time list entry bit (program is in the time list)

BA = batch (program is running under batch)

FW = father is waiting (father scheduled with wait)

M = Multi-Terminal Monitor bit

AT = attention bit (operator has requested attention)

RM = reentrant memory must be moved before dispatching program

RE = reentrant routine now has control

PW = program wait (some other program wants to schedule this one)

RN = Resource Number either owned or locked by this program

RP = reserved partition (only for programs that request it)

DC = don't copy flag

CP = copy flag

MPFI = memory protect fence index

15	12 11	2 10 15	
	TYPE	R 8	CATABLE YTE ORESS
	INSTR	UCTION WORD R - 110)

EXPLANATION

D/I: INDIRECT ADDRESSING

- 0 DIRECT
- 1 INDIRECT

MEMORY REFERENCE INSTRUCTIONS USE TWO WORDS, WITHIN THE TWO-WORD GROUP?, "MR" INDICATES RELOCATABILITY OF OPERAND SPECIFIED IN SECOND WORDS:

00 - PROGRAM RELOCATABLE

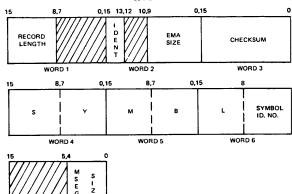

01 - BASE PAGE RELOCATABLE

10 - COMMON RELOCATABLE

11 - ABSOLUTE

EMA RECORD

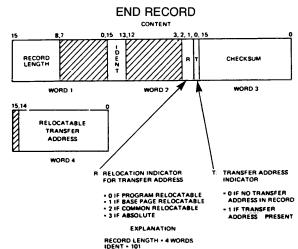

EXPLANATION

RECORD LENGTH = 7 WORD IDENT = 110

WORD 7

SYMBOL ID. NO.: NUMBER ASSIGNED TO SYMBL FOR USE IN LOCATING REFER-ENCE IN BODY OF PROGRAM.

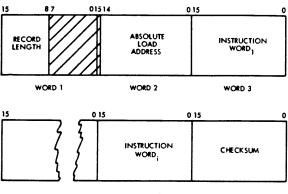

K-43

ABSOLUTE TAPE FORMAT

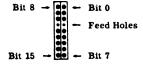

Absolute binary code is written to paper tape in the following format:

CONTENT

WORD n-1 WORD n

Each word represents two frames arranged as follows:

EXPLANATION

RECORD LENGTH = NUMBER OF WORDS IN RECORD EXCLUDING WORDS 1 AND 2 AND THE LAST WORD.

ABSOLUTE LOAD ADDRESS: STARTING ADDRESS FOR LOADING THE INSTRUCTIONS WHICH FOLLOW

INSTRUCTION WORDS:
ABSOLUTE INSTRUCTIONS
OR DATA

CHECKSUM: ARITHMETIC TOTAL OF ALL WORDS EXCEPT FIRST AND LAST

GENERAL WAIT STATE MESSAGES (State 3)

MESSAGE	REASON FOR WAIT
LULK lu, LKPRG= progx	The listed program attempted to put a lock on logical unit lu. Program progx already has a lock on lu. The listed program will be rescheduled when progx removes its lock.
RN xx, LKPRG= progx	The listed program attempted to set resource number xx. Program progx already has a lock on the resource number. The listed program will be rescheduled when progx removes the lock.
RESOURCE	The listed program attempted to allocate a resource number. The system has no more resource numbers available. The operating system will reschedule the listed program when a resource number is available.
CLASS #	The listed program requested a class number but the system has no more available. The operating system will reschedule the listed program when a class number becomes available.
CL xx	The listed program is waiting on completion of a class GET to class number xx.
progx	The listed program scheduled progx with wait. The listed program will be rescheduled when progx completes.
progx's QUEUE	The listed program scheduled progx on the queue with wait. progx is not dormant so the listed program must wait. The listed program will be rescheduled after the scheduling of progx completes.
BL,EQT xx	Buffer limit exceeded on the controller in EQT entry xx.
EQLK xxx, LKPRG= PRGA	Program suspended for a locked EQT.
EQLK TABLE FULL	Program attempts to lock an EQT and the EQT table is full.

BOOT UP PROCEDURE

- 1. Select the S-register for display on the computer front panel.
- 2. Press CLEAR DISPLAY.
- 3. Set the S-register bits as follows:

Bits:	Enter:
0-2	Surface number of the disc where the RTE-IVB system subchannel starts.
3-4	0 (reserved).
5	0 for standard boot-up.
6-11	Octal select code of the disc.
12	1 to indicate a manual boot from the S-register.
13	0 (reserved).
14-15	Loader ROM selection (number of the ROM cell containing the Disc Boot Loader).

- 4. Press STORE.
- Press PRESET, IBL and PRESET (again) to load contents of Disc Loader ROM.
- 6. Press RUN.

ASSEMBLER ERROR CODES

ERROR	PASS	DESCRIPTION
CS	1	Control statement error
DD	1	Doubly defined symbol, a name defined in the symbol table appears more than once.
EN	1	The symbol specified in an ENT statement has already been defined in an EXT statement, or is a label for an EMA pseudo-instruction.
EN UNDEF <symbol></symbol>	2	The entry point specified in an ENT statement does not appear in the label field of a machine or BSS instruction. The entry point has been defined in the Operand field of an EXT statement.
IF	1	An IFZ or an IFN follows either an IFZ or an IFN without an intervening XIF. The second pseudo instruction is ignored.
IL	1	Illegal instruction.
	1 or 2	Illegal character, a numeric term used in the Operand field contains an illegal character.
LB	1	Missing label in an EQU, RPL or EMA pseudo-instruction.
М	1 or 2	Illegal operand.

1 or 2 No origin definition, the first state-NO ment in the assembly containing a valid opcode following the ASMB control statement is neither an ORG nor a NAM statement. 1 or 2 Illegal Opcode. OP 1 or 2 Numeric operand overflow, the OV numeric value of a term or expression has overflowed its limit. There are more symbols defined in SO the program than the symbol table can handle. 1 or 2 A label field contains an illegal SY character or is greater than 5 characters, or a symbolic term in the Operand field is greater than five characters, or the source file contains more than one control statement.

1 or 2 Undefined Symbol.

UN

COMPL AND CLOAD ERROR CODES

- CL- 01 The input to the COMPL & CLOAD programs must be a source file.
- CL- 02 An FMP error was detected on the open request.
- CL- 03 An FMP read error occurred.
- CL- 04 An FMP error was detected on the close request.
- CL- 05 Control statement not in first 10 lines of the program.
- CL- 06 The language requested was rejected by the operating system. The language was purged from the system between the 'RP' and the EXEC request.
- CL- 07 The language requested in the control statement was recognized but not found.
- CL- 08 The language requested exists on the system and COMPL or CLOAD was in the process of 'RP'ing it. When the file was closed an FMP error occurred.
- CL- 09 The language requested exists on the system and COMPL or CLOAD was in the process of 'RP'ing it. However, that 'RP' failed because the checksum calculated when the language was 'SP'ed did not match the system checksum.
- CL- 10 The language requested exists on the system and COMPL or CLOAD was in the process of 'RP'ing the language. However, during the open request an FMP error occurred.

CL- 11	This session has more than 80 spool files currently residing on the spool disc.
CL- 12	The compiler was aborted.
CL- 13	The compilation was not successful. Errors or warnings were found.
CL- 14	This error results when the system is out of ID segments and it is impossible to 'RP' the compiler or LOADR.
CL- 15	This error means that one of the input parameters was in error.
CL- 30	CLOAD was trying to 'RP' the LOADR but encountered an FMP error on the close of the file that contained the LOADR.
CL- 31	CLOAD was trying to 'RP' the LOADR and a checksum error resulted.
CL- 32	CLOAD was trying to 'RP' the LOADR but encountered an FMP error on the FMP open request.
CL- 33	If the LOADR was not loaded at generation time or an illegal non supported memory or disc modification has been made.
CL- 34	The LOADR was loading your program but was aborted abnormally.
CL- 35	The load was not successful.
CL- 36	CLOAD was unable to create a copy of the LOADR and even the original LOADR was not available.
CL- 37	The list device for CLOAD must be an lubecause both the compiler and the LOADR must talk to the device.

DISC ALLOCATION ERROR CODES

DR01 Not enough parameters were specified.

DR02 The number of tracks is \leq zero or an

illegal logical unit was specified.

DR03 An attempt to release a track assigned to

another program was made.

EXEC CALL ERROR CODES

DM Mapping error. An attempt was made to

read/write outside of the mapped ad-

dress space.

MP Memory protect error, the call was not

an EXEC, \$L1BR, or \$L1BX call.

RE A re-entrant subroutine attempted to call

itself.

RQ An illegal request code is specified in an

EXEC call.

TI A batch program exceeds the allowed

time.

FMGR ERROR CODES

OR CODES
Illegal D.RTR call sequence
Illegal parameter in D.RTR call
Directory manager EXEC request was aborted
Spool not initialized or SMP cannot be scheduled
No session lu available for spool file
Greater than 255 extents
No room in SST
Lu not found in SST
Spool lu not mapped to the spool driver
Illegal scratch file number
Lock error on device
Already 63 discs mounted to system
Disc already mounted.
Not enough room on cartridge
Cartridge not found
Value too large for parameter
Queue full or max pending spools exceeded
No SPLCON room
No more batch switches
No available spool files
No available spool lu's
Illegal destination lu
Illegal access lu
Illegal access on a system disc

FMGR-018	Illegal lu
FMGR-017	Illegal read/write on Type 0 file
FMGR-016	Illegal Type 0 or size=0
FMGR-015	Illegal name
FMGR-014	Directory full
FMGR-013	Disc locked
FMGR-012	EOF or SOF error
FMGR-011	DCB not open
FMGR-010	Not enough parameters
FMGR-009	Attempt to use APOSN or force to 1 a Type 0 file
FMGR-008	File open or lock rejected
FMGR-007	Illegal security code or illegal write on lu2 or 3
FMGR-006	File not found
FMGR-005	Record length illegal
FMGR-004	Record size of Type 2 file is 0 or undefined
FMGR-003	Backspace illegal
FMGR-002	Duplicate file name
FMGR-001	Disc error, the disc is down.
FMGR 000	Break, informative message only no error has occurred.
FMGR 001	Disc error — lu reported, disc associated with the lu is down.
FMGR 002	Initialize lu 2!

FMGR 003

FMGR 004

Initialize lu 3!

003

Illegal response to FMGR 002 or FMGR

FMGR 005	Required track not available — relative TAT position reported
FMGR 006	FMGR suspended
FMGR 007	Checksum error
FMGR 008	D.RTR not loaded
FMGR 009	ID segment not found
FMGR 010	Input error
FMGR 011	Do 'OF,XXXXX,8' on named programs
FMGR 012	Duplicate disc label or lu
FMGR 013	TR stack overflow
FMGR 014	Required ID segment not found
FMGR 015	LS track report
FMGR 016	File must be and is not on lu 2 or lu 3
FMGR 017	ID segment not set up by RP
FMGR 018	Program not dormant
FMGR 019	File not set up by SP on current system
FMGR 020	Illegal Type 0 file
FMGR 021	Illegal disc specified
FMGR 022	Copy terminated
FMGR 023	Duplicate program name
FMGR 041	Program cannot be a segment
FMGR 042	Lu cannot be switched
FMGR 043	Lu not found in SST
FMGR 044	No messages waiting
FMGR 045	Session command only
FMGR 046	Insufficient capability
FMGR 047	Spool set up failed
FMGR 048	Global set out of range

FMGR 049	Can't run RP'ed program
FMGR 050	Not enough parameters
FMGR 051	Illegal master security code
FMGR 052	Illegal lu
FMGR 053	Illegal label or ilabel
FMGR 054	Disc not mounted
FMGR 055	Missing parameter
FMGR 056	Bad parameter
FMGR 057	Bad track not in file area
FMGR 058	LG area empty
FMGR 059	Reported track unavailable
FMGR 060	A re-initialization attempt will raise the first track or lower the directory tracks into the file area and destroy a file. Enter '??' or 'NO' to stop the reinitialization Enter 'YES' to continue.
FMGR 061	Do a "DC" and a "MC" on this CR
FMGR 062	More than 63 discs
FMGR 063	Exceeding session disc limit
FMGR 064	No discs available from disc pool that are big enough.
FMGR 065	Conflict in SST definition
FMGR 066	No room in SST
FMGR 067	Program not found
FMGR 068	Lu not in variable part of SST
FMGR 069	Job LOGON failed
FMGR 070	Sectors/track value too large

FMGR 071	Do "EX,SP" to save or "EX,RP" to release private cartridges
FMGR 072	Lu not interactive
FMGR 073	Account not found
FMGR 074	JO command expected
FMGR 075	Can't restore Type 6 PGM (user protected)
FMGR 076	Can't restore Type 6 PGM (group protected)
FMGR 077	Can't restore Type 6 PGM (insufficient capability)

FMGR UNNUMBERED

FRROR

MESSAGE MEANING

ABEND

The job has been aborted by operator OPERATOR request, or has been aborted because of

spool I/O error.

Error encountered during job execution. JOB xxxxx

ABORTED

AREND FOJ An :FO or :JO command was encoun-

IN ssssss

tered, but in a different level from the original: JO command. For example, control has transferred from PROG1 to PROG2_PROG2_contains :FO_or :JO command, ssssss is the file name or logical unit number where :EO or :JO

occurred.

ABEND **JOB** LIMIT

The job time limit (set via the :JO com-

mand) has been exceeded.

ABEND RUN LIMIT

The run time limit (set via the :TL com-

mand) has been exceeded.

FMGR

LU xx is down locked.

WAITING ON LU xx

FORMAT ERROR CODES

ERROR

CODE	EXPLANATION
01	a. w or d field does not contain proper digits.
	b. No decimal point after w field.
	c. $w - d \le 4$ for $E-$ specification.
02	 a. FORMAT specifications are nested more than one level deep.
	 b. A FORMAT statement contains more right parentheses than left parentheses.
03	 a. Illegal character in FORMAT statement.
	b. Format repetition factor of zero.
	 c. FORMAT statement defines more character positions than possible for device.
	d. List items remain and no conversion items are accessible in FORMAT statement.
04	Illegal character in fixed field input item or number not right-justified in field.
05	A number has an illegal form (e.g., two E's, two decimal points, two signs, etc.).

FORTRAN ERROR CODES

ERROR	
CODE	EXPLANATION
01	Compiler control statement missing
02	Error in compiler control statement
03	Symbol table overflow
04	Labeled common
05	Implicit statement used to define default type for some character more than once
06	End of file occurred before "\$"
07	Return in main program
08	Illegal complex number
09	Mismatched or missing parenthesis
10	Illegal statement
11	Illegal decimal exponent
12	Integer constant exceeds maximum integer size
13	Hollerith string not terminated
14	Constant overflow or underflow
15	Illegal sign in logical expression
16	Illegal octal number
17	Missing operand — unexpected delimiter
18	Illegal constant usage
19	Integer constant required
20	Empty Hollerith string
21	Non-octal digit in octal constant
22	Illegal usage of name

23	Do terminator defined previous to do statement
24	Illegal constant
25	Illegal subprogram name usage
26	Integer variable or constant required
27	Statement number previously defined
28	Unexpected character
29	Only statement number on source line
30	Improper DO nesting or illegal DO terminating statement
31	Statement number starts with non-digit
32	Invalid statement number or illegal usage of a statement number
33	Variable name used as subroutine name
34	Statement out of order
35	No path to this statement or unnumbered format statement
36	Doubly defined common name
37	Illegal use of dummy variable
38	More subscripts than dimensions
39	Adjustable dimension is not a dummy parameter
40	Impossible equivalence group]
41	Illegal common block extension
42	Function has no parameters or array has empty declarator list
43	Program, function or subroutine or block data not first statement
44	Name in constant list in data statement

45	Illegal exponentiation
46	Function name unused or subroutine name used
47	Format specification not a local array name, statement number or * or it is an EMA reference
48	Illegal use of EMA
49	Improper use of name
50	DO statement in logical IF
51	Control variable repeated in DO nest
52	Logical IF within logical IF
53	Illegal expression or illegal delimiter
54	Doubly defined array name
55	Logical conversion illegal
56	Operator required logical operands
57	Operator requires arithmetic operands
58	Complex illegal
59	Incorrect number of arguments for subprogram
60	Argument mode error
61	Logical IF with three branches
62	Arithmetic IF with no branches
63	Required I/O list missing
64	Free field output illegal
65	Hollerith constant with count greater than 8 used in other than format or subprogram reference
66	Program unit has no body or block data subprogram has a body

67	Source file open or access problem or EOF, END\$ or \$ occurs before end statement
68	External name has more than five characters
69	Octal string in stop or pause statement is too long
70	Equivalence group syntax
71	Dummy variable in data list
72	Common variable in data list or in block data subprogram
73	Mixed mode in data statement
74	Illegal use of statement function name
75	Recursion illegal
76	Double defined dummy variable
77	Statement number ignored
78	Program unit has no executable statements
79	Format does not start with left parenthesis
80	Format does not end with right parenthesis
81	Illegal equivalence group separator
82	Illegal use of array name in an equiva- lence group
83	Subprogram name retyped
84	Object code memory overflow
85	Possible recursion may result
86	Dummy variable in statement function cannot be subscripted

88	End or format statement in logical IF
89	Continue statement or no branch in logical IF
90	First record of subprogram is a continuation line
91	Result of rename duplicates existing external name
92	Result of rename duplicates required intrinsic
93	Data statement attempts to initialize EMA variable
94	Name in EMA statement is not formal parameter or appears twice in the statement
96	A break was detected
97	Open or write error on binary file
98	Read access error on scratch file
99	Write access error on scratch file

The use of these names as program, subprogram, or common block names may result in a recursive operation if the program, subprogram, or common block contains an implicit call to a name that duplicates its own name (see error number 85).

GASP ERROR CODES

GASP -33	Not enough room on cartridge
GASP -32	Cartridge not found
GASP -14	Directory full
GASP -13	Disc locked
GASP -12	EOF or SOF error
GASP -8	File open or lock rejected
GASP -7	Illegal security code or illegal write on lu2 or 3
GASP -6	File not found
GASP -4	More than 32767 records in a Type 2 file
GASP -2	Duplicate file name
GASP -1	Disc error, disc is down.
GASP 1	Disc associated with lu NN is down
GASP 2	Number out of range
GASP 3	Bad job number!
GASP 4	Illegal status
GASP 5	Illegal command
GASP 6	Not found
GASP 43	Lu not found in SST
GASP 46	Insufficient capability
GASP 55	Missing parameter
GASP 56	Bad parameter

I/O CALL ERROR CODES

1000 An illegal class number was specified. Outside table, not allocated, or bad security code. 1001 Not enough parameters were specified. 1002 An illegal logical unit number was specified. 1003 Illegal EQT referenced by lu in I/O call (select code=0). An illegal user buffer was specified. Ex-1004 tends beyond RT/BG area or not enough system available memory to buffer the request. An illegal disc track or sector was 1005 specified. A reference was made to a protected 1006 track or to unassigned LG tracks. The driver has rejected the call. 1007 **1008** The specified disc transfer is longer than one track. 1009 The LG tracks overflowed. Class get call issued while one call al-1010 ready outstanding. A Type 4 program made an unbuffered 1011 I/O request to a driver that did not do its own mapping. An I/O request specified a logical unit 1012 not defined for use by this session. 1013 An I/O request specified an Iu which was either locked to another program, or pointed to an EQT which was locked to another program.

IO20	Read attempted on write only spool file.
IO21	Read attempted past end-of-file.
IO22	Second attempt to read JCL card from batch input file by other than FMGR. Revise program and re-run.
IO23	Write attempted on read only spool file.
IO24	Write attempted beyond end-of-file; usually, spool file overflow.
IO25	Attempt to access spool lu that is not currently set up.
IO26	I/O request made to a spool that has been terminated by the GASP KS command.
IOET	An end-of-tape condition occurred on the specified lu.
IONR	The specified lu is not ready. Make the device ready and set the EQT up.
IOTO	The specified lu has timed out.
IOPE	A parity error occurred in the data transmission from the specified lu.
ILL	INT an illegal interrupt occurred on the specified channel.

Utility Subroutines

Subroutine Error

MAGTP Returns on an illegal call.

.SWCH Returns if element is out

of range.

LOADR ERROR CODES

C-CK SUM

L 01 This is a checksum error. Most likely you specified a file to the LOADR that did not contain relocatable format code.

L-IL REC

L 02 The LOADR found a record that was not a NAM, ENT, EXT, DBL, EMA, or END record.

L-OV MEM

L 03 The size of the code loaded so far exceeds the max size that you specified or exceeds the largest possible size for a program.

L-OV BASE

L 04 Base page overflow. This program has used too many base page links.

L-OV SYM

L 04 This is a symbol table overflow.

L-CM BLK

L 06 This is a common block error.

L-DU ENT

L 07 Duplicate entry point.

L-TR ADD

L 08 No transfer address. Only subroutines were loaded.

L-RE SEQ

L 09 Record out of sequence.

L-IL PRM

L 10 The run string submitted to the LOADR was in error.

L-CO RES

L 11 Attempt to replace a memory resident program.

L-OV FIX

L 12 Fixup table overflow.

L-LM LIB

L 13 The limit on the number of libraries specified by the 'LI' command has been exceeded (10).

L-IL REL

L 14 The compiler produced an illegal record. Recompile.

L-IL PTN

L 16 You specified a partition in the load of the program, however, that partition does not exist or has been downed due to a parity error.

L-RQ PGS

L 17 The number of pages that you specified in the load of the program exceeds that number of pages in the partition you specified.

L-OV PTN

L 18 The specified program size is too large for the partition.

L-ML EMA

L 19 Illegal EMA declaration.

L-ID EXT

L 20 No ID extensions available for the EMA program.

L-SZ EMA

L 21 The programs declared EMA size is too large for this systems partition definitions.

L-SS ENT

L 24 You attempted to access an SSGA entry point but you did not 'OP,SS'.

L-IL CMD

L 25 Attempt to purge a program under batch or attempt to use the 'LI' or 'PU' commands within a LOADR command file.

L-ID SEG

L 26 Not enough short and long ID segments to finish the load.

L-RF EMA

L 27 Attempt to access an EMA external with offset or indirect.

L-UN EXT

L 28 Undefined externals exist which prohibits the load from completing.

L-EX CPY

L 29 Attempt to replace or purge a program where copies of that program exist.

L-RP CPY

L 30 Attempt to replace a copied program.

L-PE LDR

L 31 Trying to do a purge or permanent load with a copy of the LOADR.

L-DU PGM

L 32 You tried to load the same program several times but did not remove the earlier loads.

L-NO IDS

L 33 Not enough ID segments to finish the load.

L-RP PGM

L 34 You tried to replace a permanent program.

LOGON ERROR CODES

this is an informational diagnostic. The LGON 06 station (terminal) being logged onto has a configuration table entry which is a duplicate of an entry in the users

account file entry.

LGON 09 Your session has exceeded the maximum session switch table size.

LGON 11 The LOGON program received the specified error when attempting to mount a private or group disc to this session.

LGON 13 LOGON detected a user SST which attempted to redefine a system disc's logical unit number.

LU LOCK ERROR CODES

LU01 A program has one or more logical units

locked and is trying to lock another with

wait.

LU02 Illegal logical unit reference.

LU03 Not enough parameters are furnished in

the call.

11104 Trying to lock a logical unit not defined in

caller's SST.

OUTSPOOL ERROR MESSAGES

MESSAGE CAUSE

JOB WAIT End-of-Tape occurred between :JO and

ON PT :EO commands.

JOB WAIT Required spool file or logical device

ON SPOOL cannot be obtained at this time.

RESOURCE

JOB WAIT Spool file overflows available disc

ON space.

FXTENT

END JOB JOBFIL could not be opened; or other ABNORM uncorrectable error occurred; or JOB

was run before spool initialization.

BAD EOF Message appears after last line of file.

ASCII file outspooling overflowed; or was

otherwise incomplete.

READT/WRITT ERROR CODES

- **READ 001** The requested mag tape unit is down.
- **READ 002** The mag tape READT is trying to restore contains information in a format not restorable by READT.
- READ 003 The mag tape unit you wish to use is locked to some process.
- READ 004 The parameter describing the desired mag tape unit does not satisfy READT's requirements for a legal mag tape lu.
- **READ 005** The desired mag tape unit is off-line.
- READ 006 READT rejected the use of the specified disc lu.
- **READ 007** The driver detected a parity error when reading from the mag tape.
- READ 008 The end of tape was reached.
- READ 009 The desired cartridge has a file open or the cartridge is locked to another program.
- READ 010 You are operating in a nonsession environment. An lu must be specified (negative lu) since there isn't a free disc pool.
- READ 011 READT rejected the size (number of tracks) you specified.
- READ 012 The routine READT uses to mount a cartridge detected an error.
- READ 013 The desired disc lu or the available free lus in the disc pool are not large enough to restore the cartridge that's on the mag tape.

	tem discs.
WRIT 003	The mag tape you wish to use is locked to some process.
WRIT 004	The parameter describing the desired mag tape unit does not satisfy READT's requirements for a legal mag tape unit.
WRIT 005	The desired mag tape unit is off-line.
WRIT 006	A write ring is required to write information on a mag tape.
WRIT 007	The driver detected a parity error when reading from the mag tape.
WRIT 008	The end of tape was reached.
WRIT 009	The desired cartridge has a file open or the cartridge is locked to another program.
WRIT 010	The desired cartridge or disc lu could not be found.
WRIT 011	WRITT rejected the use of the specified disc lu.
WRIT 012	You cannot save FMP tracks off lu 2 or lu 3 (if 3 exits) with WRITT.

READ 014 The FMP tracks on lu 2 or lu 3 (if 3 exits) are not restorable with READT.

WRIT 001 The device can be enabled.

Only the system manager can save sys-

WRIT 001 WRIT 002

RECONFIGURATION ERROR CODES

	Olivinon Elition Cobec
CONFIG	
ERR	MEANING
1	Invalid LU number or a bit bucket LU.
2	Illegal select code number.
3	New select code entered is identical to new select code assigned to disc sys- tem console or list device, or else the current select code entered is identical to the old select code for disc, system console or list device (i.e., do not re- configure that which was already done via the SWTCH register).
10	Specified total number of pages outside the range.
11	Invalid bad page number.
12	Specified SAM extension entry beyond physical memory size due to bad pages.
13	Current running total exceeds available pages in block of good memory or exceeds size of mother partition.
14	Second parameter of partition definition entry other than RT, BG or S, or else S was entered when a subpartition definition was not expected.
15	Third parameter of partition definition entry other than R.
16	No such program, or the name of a segment was entered or invalid type was entered for partition assignment.

Invalid partition number. 17 Program does not fit in the assigned 18 partition. Invalid number of pages was entered for 19 program size. 20 Number of defined partitions already equal to allowed maximum number and more undefined pages remain. 21

Page requirements of an EMA program cannot be modified.

22 Number of pages in SAM extension requires division into more than five

blocks.

RESOURCE NUMBER ERRORS

RN00 There are no option bits set in the call.

Not used RN01

The specified resource number is not RN02

defined.

An unauthorized attempt was made to RN03

clear a local resource number.

SCHEDULE CALL ERROR CODES

SC00 A batch program attempted to suspend

(EXEC(7)).

Missing parameter. **SC01**

Illegal parameter. SC02

The specified program cannot be SC03

scheduled.

SC04 The specified program is not a subordinate (or "SON") to the program issuing

the completion call.

SC05 The program given is not defined.

SC06 No resolution code is specified in the

execution time EXEC call.

A prohibited core lock was attempted. SC07

The program just scheduled is assigned SC08

to a partition smaller than the program itself or to an undefined partition.

The program just scheduled is too large SC09 for any partition of the same type.

There is not enough system available SC10

memory for the string passage.

SC11 EXEC schedule or timed execution reguest was issued and program specified

is already in the time list for another

session.

SMP ERROR MESSAGES

ERROR

MESSAGE MEANING

SMP:LU xx File filename just outspooled to logical EOFER unit xx overflowed or was otherwise

filename incomplete.

SMP:LU xx Logical unit xx down: filename placed in

DOWN active hold. filename

HELD

SMP:FMP FMP error –nn occurred during SMP operation. Usually indicates loss of JOB-

FIL of SPLCON.

SYSTEM AND BREAK-MODE COMMAND ERROR MESSAGES

ERROR

MESSAGE MEANING

OP CODE ERROR Illegal operator request code.

NO SUCH

The name entered is not a main program

in the system.

INPUT ERROR A parameter is illegal.

ILLEGAL STATUS Program is already scheduled.

IGNORED — NO MEM

CMD

Not enough system available memory exists for storing the program's com-

mand string.

ILLEGAL PART'N Partition does not match command

request.

SIZE ERROR Illegal program size specified or size of program specified larger than its

assigned partition or any partition.

SYSTEM BO	OOT-UP HALTS (front panel) MEANING
4	Powerfail occurred and powerfail automatic restart is enabled.
5	Memory protect switch was set and memory parity error occurred.
10B	FMGR or D.RTR cannot be scheduled at startup because there is not a large enough partition (issued by the system).
11B	Attempt was made to re-execute a non-RPL compatible ROM Loader Part # 12992A, or Bootstrap Loader.
22B	SCNFG cannot find an ID segment for Configurator extension \$CNFX, \$CNFX is not a Type 3 program, or a contiguous memory block of three good pages cannot be found in the user partition area.
30B	Error was encountered in the disc I/O process by one of the RPL-compatible ROM Loaders Part # 12992B and 12992F. If the disc is a 7900 the disc status is displayed in the A-register. If the disc is a 7905/20 the disc status word 1 is displayed in the B-register and disc status word 2 in the A-register.
31B	Error encountered in the disc I/O process by the Boot Extension. If the disc is a 7900, the disc status is displayed in the A-register. If the disc is 7905/06(H)/20(H)/25(H), the disc status word 1 is displayed in the B-register and disc status word 2 is displayed in the A-register.
55B	An EQT with the equipment type code of console cannot be found.
