# DIAGNOSTIC TEST

DIPAL NAME IS DT22

**TITLE** FAULT ISOLATION - DT0022  
**MACH. TYPE** 1311 **BY** GIF **APPR.** CSF **DATE** 4/8/63

# ENGINEERING CHANGE HISTORY

E/C NO.	404860-A	404908	404980				
DATE	5-3-63	7-30-63	5-7-64				

## 1311 DIAGNOSTIC TEST 0022

## FAULT ISOLATION

**A. SCOPE:**

This test was designed primarily to detect and isolate malfunctions in the operation and control of the 1311 Disk Storage Drive and requires that the CE Disk Pack, with test data written of cylinder 97 by DT 0021, be on the Disk Storage Drive.

The detection and isolation portion of the test checks the write operations; therefore, precautions should be taken to protect customer packs installed on multiple module systems.

The C.E. Pack may be on any module of a multiple module system, but the addresses must be 00000-19999. These must be written with DT 0020..

It checks the seek operation, read, write, and read back check (with and without wrong length record check) operations. It also checks that the error indicators, address check, overflow, wrong length record check, and any file, are functioning properly.

The test also contains a routine to verify that the addresses on a cylinder are correct. Since the only file instructions used by this routine are seek and read full track, this routine may be used with a customer's disk pack; however, CAUTION SHOULD BE EXERCISED not to enter the detection and isolation portion of the test while the customer's disk pack is on the Disk Storage Drive.

**B. SET UP:**

1. While running the test, the program switches have the following functions:

Switch 1	ON	Bypasses error typeouts
	OFF	Allows error typeouts
Switch 2	ON	Loops routine
	OFF	Proceeds to the next routine
Switch 3	ON	Halts on error
	OFF	Bypasses halt on error
Switch 4	ON	Loops test
	OFF	Test Completion, Halt

2. Switch 3 has two additional functions during the set up phases. One function is to insure that the CE Disk Pack has been installed, and the other is to allow corrections if an error is made while keying

in data from the console typewriter.

After the name of the test is typed out, the instructions to remove all customer packs and turn switch 3 on are typed out. The program remains in a loop, branching to an instruction that checks switch 3, until switch 3 is turned on. Additional instructions (switch functions, etc.) are typed out after switch 3 is turned on. Switch 3 must be turned off to permit the entry of keyed in data; since switch 3 is the correction switch.

To make corrections when keying in data from the typewriter, turn console switch 3 on, press release and start. Then turn switch 3 off and key in data again.

### 3. File Switches

WRITE ADDRESS SWITCH -- OFF  
COMPARE DISABLE SWITCH -- OFF (IN)

### 4. Normal setting of 1620 Console Switches

Program Switches -- AS DESIRED  
Data Switches -- Program

5. The user should insure that the PACK ON and READY lights on the Disk Storage Drive are ON.

### 6. LOADING PROGRAM

A. Clear core by inserting and executing 31 00003 00002

B. Paper Tape input

1. Load tape in reader
2. Insert and execute 36 00000 00300
3. After paper tape has loaded core, depress computer start.
4. Follow typed out instructions.

C. Card Input

1. Place cards in read hopper

- (2) Place 1620 in manual mode
- (3) Depress load key
- (4) Depress computer start after cards have loaded core
- (5) Follow typed out instructions

C. DETAILED EXPLANATION:

This test was designed to detect and isolate malfunctions in the 1311 Disk Storage Drive Units. The messages typed out whenever a malfunction is detected will indicate the symptoms of and the function being performed when the malfunction occurred. Some malfunctions may cause "hang-ups." This is still a detection and proper utilization of the console indicators and the instruction being performed should provide information for a diagnosis of the malfunction.

To aid in the diagnosis of the malfunction, this test has been designed in routine form, each routine performing some logical function. These routines are:

Control Routine

Address Check Routine

Locate a Properly Functioning Head Routine

Check Seek Routine

Read and Head Test Routine

Check Disk Operations Routine

Overflow and Wrong Length Record Check Routine

Any File and Any Data Check Routine

Read Only Address Routine

Test Complete Routine

Error Routine

Reset VRC Routine

The Control Routine is comprised of a group of routines to type the name of the test, switch settings, pertinent instructions regarding the operation of the test; to allow the keying in of essential information for proper operation of the test; to compute the drive code digit and store it in the Disk Control Field (sub-instruction).

The input entered during the execution of the Control Routine is:

1. Yes or No, entered from the console typewriter in answer to the question "Check Flag Address, Type Yes or No." Enter YES, if the Read-Only operation is to be checked. This routine will also check that addresses which are not sequential and incremented by one, will turn on the Address Check Indicator
2. One digit Module number, entered from console typewriter indicating the Disk Drive Unit on which the CE Pack is installed.

After the module number has been entered, the drive code digit is computed and stored in the F<sub>0</sub> digit of the

disk Control Field sub instructions. The calculation of the drive code gives the following results:

<u>Module No.</u>	<u>Drive Code</u>
0	1
1	3
2	5
3	7

Once the Control Routine has been executed, all the necessary initialization and "housekeeping" has been accomplished, the actual checking can be performed.

The Address Check Routine checks for proper operation of the Address Check Indicator. This indicator must be functioning properly to be used to help diagnose malfunctions. A seek of cylinder 97 is executed; then an attempt to force on the Address Check Indicator is made by reading sector 00000. If the address check is forced on, then a program check is made to verify that the access mechanism was positioned at cylinder 97. This can be done by reading a full track and checking the address read. If the address check is not forced on by reading sector 00000, a program check is made that addresses can be read from the Disk Storage unit into the 1620 core storage, whether the correct Disk Storage

Drive unit was selected, and whether or not the arm was positioned at cylinder 97. The results of this program analysis is typed out and the routine repeated until an address check is forced with the arm at cylinder 97 and sector 00000 being read.

The "Locate a Properly Functioning Head Routine" is executed after the proper verification of the address Check Indicator. This routine determines which head will be used to verify that the seek commands are functioning properly. A read numeric sector without wrong length record check instruction is executed. The parity indicators Read Check, MBRE, MBRO, and Address Check are interrogated. These must be off for proper operation. If any of these indicators are on, a malfunction is indicated. The first digit of the sector read is checked to see if it compares with the digit that selects that head. These two digits must be the same for proper operation. If these checks indicate correct operation, this head is used to check the seek commands. This check starts with head zero and continues through the heads until the first properly functioning head is located. If

a good head is not located out of the ten possible, the routine is repeated until a good head is found.

The Check Seek Routine accesses to cylinders 11, 22, 33, 44, 55, 66, 77, and 88. After the seek command has been executed a read numeric sector without wrong length record check is executed. The Address Check Indicator is then interrogated. If the indicator is on, a malfunction has been detected and an error message is typed out. The message will include the cylinder number at which the access mechanism is positioned. This cylinder number is calculated by first executing a read disk track numerically and then operating on the first five digits read into the 1620 core storage.

The Read and Head Test routine checks for correct operation of the read amplifier and all heads. To do this the test data that was written on cylinder 97 of the CE Disk Pack by DT 0021 is generated and stored in the 1620 core storage area labeled A1. Then a seek command is executed to position the access mechanism at cylinder 97. A check is made

that cylinder 97 was reached by interrogating Any Data check to see that it is off (indicating no parity checks) and by reading a sector with an address on cylinder 97 and verifying that no address check results. Then a read in area, labeled A2, is set to zero. The first record of the track is read into the read in area A2 and a check made that no parity check indicators were turned on. Then a program compare is made that the data read in compares with the generated data in area A1. If not, an analysis is made to see if the data or the head number is correct, and the appropriate error message is typed out. This procedure is repeated until the first record of all ten tracks on cylinder 97 have been read.

The Check Disk Operations Routine is comprised of several smaller routines. The first of these smaller routines test the read track with and without wrong length record check operations. Then the write disk numerically with and without wrong length record check and the read back check operations are tested in the next four smaller routines.

The read track without wrong length record check is performed on cylinder 97 by executing a read

disk numerically using the good head found in the Locate a Properly Functioning Head Routine verifying that no parity checks were turned on, and performing a program compare of the last address. If any of these checks give a negative result, the appropriate error message is typed out. If the results indicate proper operation, the routine is repeated for all heads using the read disk numerically with wrong length record check instruction. The same tests are made on the parity circuits and comparing the last address. Appropriate error messages are typed out if a malfunction is indicated.

The write amplifier and the write and read back compare instructions are tested on cylinder 03. First the access mechanism is given a seek command to position it at cylinder 03. Verification that it reached cylinder 03 is made by interrogating the Any Data check after the seek operation and performing a read disk numerically without wrong length record check to see that no address check occurs. Once the access mechanism is positioned all heads starting with 0 and ending with 9, are used to write the test data on their respective tracks using the write Disk Numerically without Wrong Length Record check instruction. The Check Disk Numerically and a program compare of the data read into core storage

with a Read Disk Numerically instruction are used to verify that the data was actually written. The parity check circuits are interrogated after each Disk Storage Operation. Appropriate error messages are typed out if any malfunctions are detected.

After head 9 has checked in the Without Wrong Length Record Check mode, zeros are written on all tracks of cylinder 03. A Check Disk Numerically command is used to verify that the zeros were written on each track.

After the tracks on cylinder 03 have been set to zero, the test data is written on cylinder 03 using the Write Disk Numerically with Wrong Length Record Check mode. The Check Disk Numerically with Wrong Length Record Check and the program compare of the data written are performed for each track to verify correct operation. Appropriate error messages are typed out whenever malfunctions are detected.

The Overflow and Wrong Length Record Check Routine is entered upon completion of the Check Disk Operation Routine. This routine checks that

Overflow and Wrong Length Record (WLR) Check indicators can be turned on and they in turn turn on the Any File Check. An attempt is made to turn on the Overflow Indicator by reading 21 sectors from the bottom track of cylinder 03. The Any File and the Overflow Indicators are interrogated, and appropriate error messages are typed out if one or the other or both are off. If both indicators are on, the routine to test the WLR Check indicator is entered.

Three attempts are made to turn on the WLR Check Indicator. The first attempt is by writing a sector, changing a digit in the write data and then executing a Check Disk Numerically with Wrong Length Check against this altered data. The Any File and WLR Check Indicators are interrogated for being on. If they are off, appropriate error messages are typed out. The next two attempts to turn on the WLR Check indicator are made by the placement of the group mark. The first of these attempts is made with the group mark located such that it is detected before the 100 character sector is read. The second is if the group mark is detected after more than 100 characters are read. After each of these attempts, the Any Check and WLR

indicators are interrogated, and the appropriate error message typed out if they are not on. The last check of the WLR Check indicator is a test to determine that it is not turned on when the group mark is located properly.

The Address Check Indicator is turned on by reading a sector not on the cylinder at which the access mechanism is position. A check is made that the Any File and The Any Data Check Indicators are on. If they are not, the appropriate error messages are typed out.

The Read-Only Address Routine is entered only if yes was keyed in during the execution of the Control Routine when the question is asked "Check Flag Address". This test required the turning on and off of the Write address and Comp are Disable Switches. During the execution of this routine, the Compare Disable and Write Address Switches must be turned on so that flagged addresses can be written on the track. A read disk numerically command is executed and a flag is set over the the first sector address and one address is set out of sequence. After the proper switches have been

turned on, the track is written. Then Instructions are typed out requesting the Write Address and Compare Disable switches to be turned off. When the switches have been turned off, an attempt is made to write on the sector with the flagged address. This should force an address check. If it doesn't, an error message is typed out. Then a read of the track is attempted and the Address Check should be turned on again because the addresses are out of sequence. If the Address Check is not turned on, an error message is typed out. Then the Compare Disable and Write Address Switches must be turned on so that the addresses can be written to their proper configuration. After this is accomplished, the Compare Disable and Write Address Switches must be turned off.

The test complete routine checks program switch 4 to determine if the test is to be looped or not.. If switch 4 is on, the test is looped until switch 4 is turned off. Then program switch 1 is interrogated to see if any error messages were bypassed.

The error map is checked to see if any errors occurred while running the test. If any errors occurred and had been bypassed, this message types out before the test complete message is typed out.

The Error Routine contains the instructions to type out the appropriate error message, sets a digit in the error map, and returns to proper location in the program.

The Reset VRC Routine is entered whenever it is desired to turn off the VRC indicators. It is entered by a Branch and Transmit Immediate instruction and completed by a branch back instruction.

D. ERROR ANALYSIS

RD TK, NO ADRS, ADRS CK IND OFF

ER51 01002

This type out occurs in the Address Check Indicator routine if the Address Check Indicator is off, and a read track instruction is used to read a track into memory and no address was read in. Prior to doing the read track instruction, a record mark is set in the address area. This record mark is still in the address area to cause this type out.

ADRS CK IND (36) WONT TURN ON

ER52 01146

This type out occurs in the Address Check Indicator routine. The routine attempts to read sector address 00000 from cylinder 97 and should turn on the Address Check Indicator. The failure to turn on indicator 36 results in this type out.

HDS AT CYL XX, SHD BE CYL 97

ER54 01146

This error type out occurs if cylinder 97 is not accessed to when positioning the access mechanism for the Address Check Routine. XX is the cylinder at which the access arm is positioned.

SELECTING WRNG STORAGE DR, DISK PACK SCTR ADRS RANGE X

ER 70 01062

This type out occurs in the Address Check Routine if the wrong module was selected when accessing to cylinder 97 of the module on which the CE Pack is installed, and the module has sector addresses in the range indicated by X, where X can be:

<u>X</u>	<u>Range</u>
1	20000 - 39999
2	40000 - 59999
3	60000 - 79999
4	80000 - 99999

ADRS CK IND 36 OFF

ER80 01062, 01146

Address Check Indicator 36 is off.

RD, MBR-E/O, ADS CK, OR WRNG HD RD TK, ON ALL HDS

ER55 01722

This type out occurs in the Locate a Properly Functioning Head Routine if a Read, MBRE, MBRO, Address Check occurred while attempting to read all ten heads or the track read did not correspond to the expected track.

This indicates that no head is functioning properly.

HDS AT CYL XX SHD BE CYL YY

ER56 01998

This type out occurs while checking the seek operation. The access mechanism is at cylinder XX and should be at cylinder YY. YY will be 11, 22, 33, 44, 55, 66, 77, or 88.

HDS AT CYL XX SHD BE CYL 03

ER61 03558

This type out occurs if the access mechanism is not positioned at cylinder 03 to check write and read back check operations. XX is the cylinder at which the access arm was positioned.

ADRS CK IND WONT TURN ON VIA A WR ON FLG ADRS

ER65 05550

This type out occurs when testing the Read-Only operation. An attempt is made to write on a flagged address, which should turn on the Address Check Indicator, but the Address Indicator was not turned on.

ADRS CK IND WONT TURN ON VIA ADRS NOT INCR BY ONE

ER66 05634

This type out occurs if the File Address Check Indicator was not turned on when reading three sectors whose addresses are not increment by one.

OVFLO CK (38) WONT TURN ON

ER62 04494

This type out occurs if the Overflow Check Indicator (38) is not turned on and Any File (39) is on.

ANY FILE 39 OFF, OVFLO 38 OFF

ER71 04530

This type out occurs if both the Overflow Check Indicator (38) and Any File (39) are not forced on.

ANY FILE 39 OFF, OVFLO 38 ON

ER72 04530

This type out occurs if the Overflow Check Indicator 38 was turned ON, but Overflow failed to turn on Any File.

WLR CK (37) WONT TURN ON VIA RD BK ER

ER63 04686

This type out occurs if a Read Back compare error does not turn on the Wrong Length Record Check Indicator (37), but Any File is on.

PN 2161822  
EC 404860A

ANY FILE 39 OFF, WLR 37 OFF

ER73 04722

This type out occurs if both the Wrong Length Record and Any File Indicators are off when forcing a read back compare error.

ANY FILE 39 OFF, WLR 37 ON

ER74 04722

This type out occurs if the Wrong Length Record Indicator is turned on, but it failed to turn on Any File.

WLR CK (37) WONT TURN ON VIA GM LATE TERM ER64 04842

This type out occurs if the Wrong Length Record Check Indicator is not turned on by reading a sector with WLR Check with late termination of the Group Mark.

WLR CK (37) WONT TURN ON VIA GM EARLY TERM

ER68 04914

This type out occurs if the Wrong Length Record Check Indicator is not turned on by reading a sector with WLR Check with early termination of the Group Mark.

WLR CK ON, GM CORRECT PLACE, RD SCT WLR ER67 04962

This type out occurs if the WLR Check is turned on during a read sector operation and the group mark is located correctly.

ANY FILE 39 OFF, ADRS 36 OFF

ER75 05082

This type out occurs if the Address Check Indicator cannot be turned on by reading a sector not on the accessed cylinder.

ANY FILE 39 OFF, ADRS 36 ON

ER76 05082

This type out occurs if the Address Check Indicator does not turn on the Any File Indicator.

ANY DATA ON, ANY FILE OFF

ER77 05190

This type out occurs if the Address Check Indicator is on, Any File Indicator is off, and the Any Data Check is on. Ignore error type out if Address Check is not on.

ANY DATA OFF, ANY FILE ON

ER78 05250

This type out occurs if the Any File Indicator does not turn on the Any Data Check Indicator.

ANY DATA OFF, ANY FILE OFF

ER79 05250

This type out occurs if the Address Check Indicator and the Any File Indicator are both off. Ignore error type out if address check does not turn on Any File.

ERROR OCCURRED BY SWITCH 1 WAS ON THUS NO ETO

ER30 05850

This error typeout will occur in the test complete routine if the user has Switch 1 on and an error occurred during the running of the test.

ETO = Error Type Out.

All other error type out use the following standard format:

AAAAAAA BBBBBB (XX) CYL ZZ HD Y

Explanation of code letters:

AAAAAAA, indicates the 1311 operation on which the error occurred,  
and can be one of the following:

WRITE 20 SCT WLR

ER3 03728

The program is writing 20 sectors from memory onto a track on the Disk  
Pack with Wrong Length Record Check.

READ BK COMP WLR

ER4 03834

The program is executing a read back compare of the data previously  
written on the Disk Pack with Wrong Length Record Check.

READ TK W/O WLR

ER5 03066

The program is reading a track of data and addresses from a track on  
the Disk into memory without Wrong Length Record Check.

RD TK WITH WLR

ER5G 03066

The program is reading a track of data and addresses from a track on  
the Disk into memory with Wrong Length Record Check.

PROG COMPARE

ER6 02778, 04050

The program is doing a program compare of the data written with the data  
read.

WR 20 SCT W/O WLR

ER3G 03728

The program is writing 20 sectors from memory onto a track on the Disk Pack without Wrong Length Record Check.

RD BK CK W/O WLR

ER4G 03834

The program is executing a read back compare of the data previously written on the Disk Pack without Wrong Length Record Check.

RD 20 SCT, WLR

ER6G 03930

The program is reading 20 sectors from the Disk Pack into memory with Wrong Length Record Check.

RD 20 SCT, W/O WLR

ER6GM 03930

The program is reading 20 sectors from the Disk Pack into memory without Wrong Length Record Check.

READ SECTOR W/O WLR

ER5S 02670

The program is reading a sector from the Disk Pack into memory without Wrong Length Record Check.

SEEK

ER8 00870, 01926, 02358, 03486

The program has performed a seek operation.

CYL 3 ZERO RESET

ER9 04182

The program has executed a write and read back check of 20 sectors of data (all zeros) in an attempt to insure a change of data on cylinder 03.

RD TK WLR, ADRS NOT EQ

ER59 03198

The program is checking the read track operation under Wrong Length Record control. The address that was read in was not correct.

RD TK W/O WLR, ADRS NOT EQ

ER60 03198

The program is checking the read track operation without Wrong Length Record Check. The addresses that were read in were not correct.

BBBBBB (XX) can be one of the following:

ADS CK (36)

ER10 05994

WLR CK (37)

ER11 06114

OVFO CK (38)

ER12 06138

RD CK (06)

ER14 06174

WR CK (07)

ER15 06198

MBR-E (16)

ER16 06222

PN 2161822  
EC 404860A  
MBR-O (17)

ER17 06246

FILE NO IND (39)

ER13 06138

The program found Any File Indicator on, but all the indicators which turn it on are off.

DATA NOT EQUAL

ER7 04062, 02790

The program compare of the data written and the data read. The data failed to compare.

RD TK X

ER57 02838

The program has read the wrong track, where X is the track that was read.

SELECT LOCK

ER19 05994

CORRECT TK, DATA NOT COMP

ER58 02838

The program is checking the read amplifier. The correct track was read, but the data read into memory fails to compare.

CYL ZZ HD Y

ER20 06354

Indicates which Cylinder (CYL) the error occurred on, where ZZ will be from 00 to 99, and also which head (HD) or track was used, where Y will be from 0 to 9.

**E. SERVICE HINTS:**

A routine has been included in DT 0022 to assist the CE if the customer reports address checks. This routine is designed to verify that the addresses on a cylinder are correct. Since this routine may be used with a customer's pack on the Disk Storage Drive Unit and the other phase of DT 0022 must be used with a CE Pack, CAUTION must be used to not enter any other portion of DT 0022 until the CE Pack has been installed.

To enter the routine to check sector address, DT 0022 must be loaded. Then the user must insert and execute a 49 06042. The routine will request the module number and a two (2) digit cylinder number and a one (1) digit address range.

1 digit address range	Sector address
0	00000 - 19999
1	20000 - 39999
2	40000 - 59999
3	60000 - 79999

The program reads the tracks and checks the sector addresses read with what should have been read.

Error typeout:

XXXXX S/B YYYYY

XXXXX is the sector address read from disk.  
YYYYY is what should have been read in.

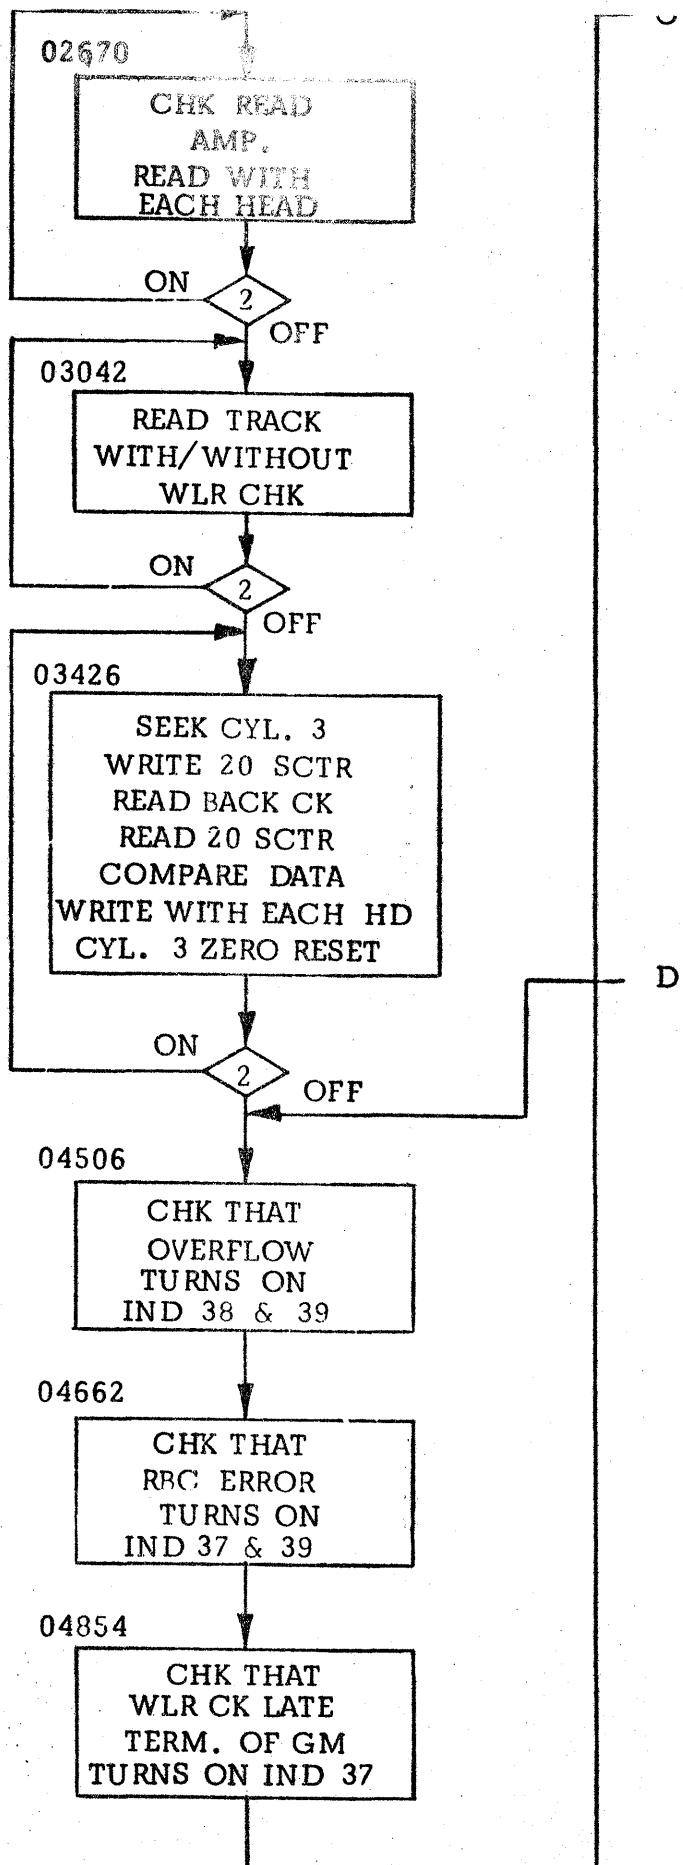

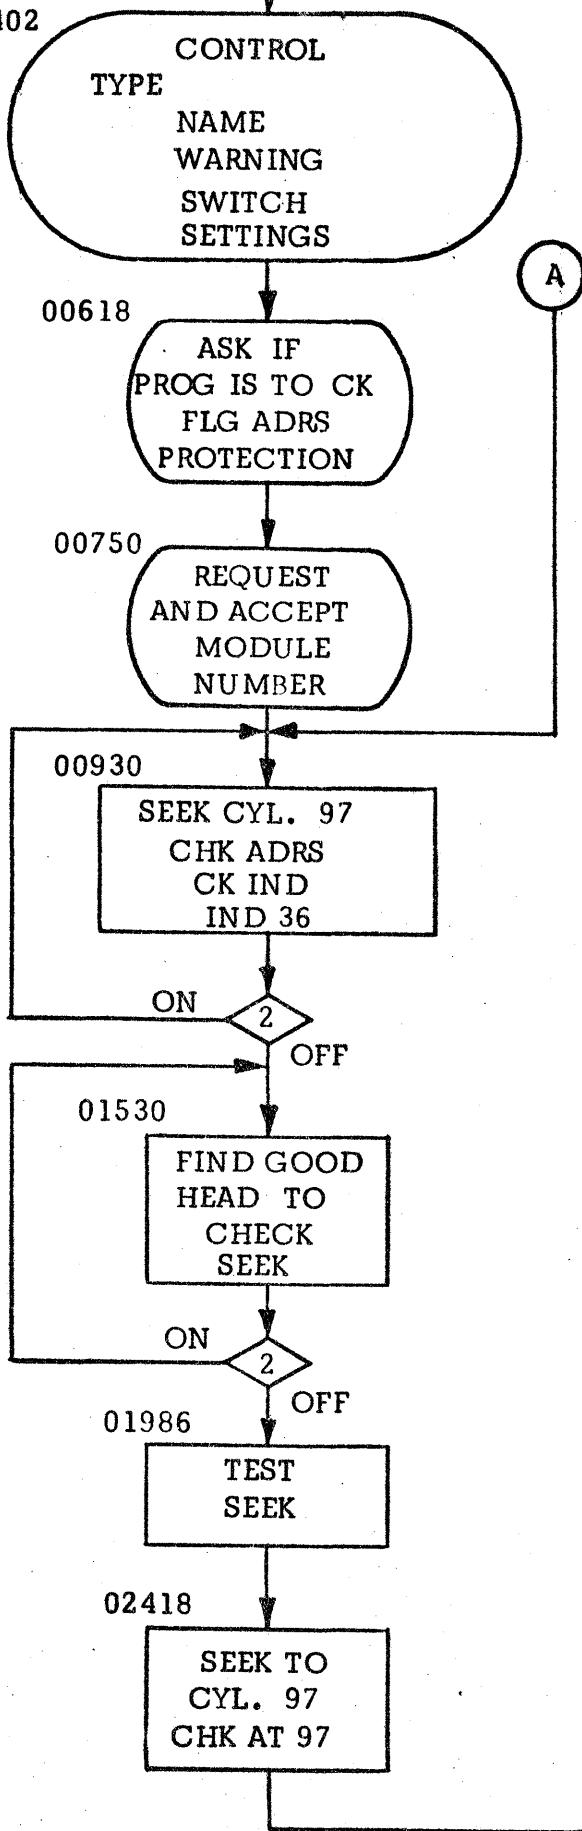

Switch 2 on, will loop the checking of the cylinder.
