1. SPECIFICATIONS

The INFOTON I200 is a stand-alone alphanumeric display terminal for use in data entry and retrieval systems where a highly flexible interaction between man and machine is desired. The I200 incorporates such important standard features as cursor addressing, conversational mode, and an Infotone which operates on the bell code. Complete specifications are listed in INFOTON Document No. 03231.

1.1 BASIC SYSTEM

Power	Domestic: 120 watts, 105–130 volts; 60 Hz Export: 120 watts; 105–130, 210–260 volts; 50 Hz
Temperature	Operating: 5° to 40°C Storage: -30° to 70°C
Humidity	5% to 80% non-condensing
Dimensions, Terminal	13 inches high, 17 inches wide, 16 inches deep (33 cm x 43 cm x 41 cm)
Weight, Terminal	35 pounds (15.8 Kg)
Dimensions, Keyboard (200/1)	3 inches high, 17 inches wide, 8 inches deep (7 cm x 43 cm x 20 cm)
Weight, Keyboard	7 pounds (3 Kg)
Screen Size	12 inch diagonal (30 cm)
Display Size	8-1/2 inches wide, 6 inches high (21 cm x 15 cm)
Characters/Line	80
Lines	24, 12 Lines Optional
Line Spacing	0.45 character height (11 mm)
Character Format	9 x 9 dot matrix
Character Spacing	0.4 character width
Character Size	0.08 x 0.19 inch nominal (2 mm x 5 mm)
Character Repertoire	64 ASCII Standard, 95 ASCII Optional
Refresh Rate	Domestic: 60 times a second ± 0.5 Hz Export: 50/60 times a second ± 0.5 Hz
Cursor	Non-destructive blinking underscore
Transmit Data	Character by character as entered by the keyboard.

1.2 STANDARD INTERFACE

The Asynchronous Serial Interface is a multi-purpose serial data interface which provides maximum flexibility in operator switch selectable data rates, and operation modes that can be applied to allow operation under a wide variety of serial data input and output situations. A panel at the rear of the display contains switches and connectors that allow the operator to match both the standard EIA RS232C voltage interface and the teletypewriter compatible 20/60 mA current loop interface for serial communications and computer interfaces.

The operator selectable functions include the following:

1. Sixteen data rates — 50, 75, 110, 134.5, 150, 200, 300, 600, 1200, 1800, 2400, 3600, 4800, 7200, 9600, 19,200 bits per second.
2. An external TTL clock input
3. Local Copy
4. Ten or eleven bit code selection (one or two stop bits)
5. Odd, Even, Mark or Space Parity
6. Normal or strapped Request-to-Send
7. Normal or Reversed Video
8. Page or Bottom Line Entry Mode
9. 20 or 60 mA teletypewriter compatible current loop interface
10. EIA RS232C interface

I200 CODE SET

THE AREA ENCLOSED BY DASHED LINES REPRESENT LOWER CASE CODES WHICH ARE DISPLAYED AS UPPER CASE CHARACTERS WHEN THE LOWER CASE OPTION IS NOT INSTALLED.

Figure 2 ASCII Character Set

1.3 OPTIONS

- Scroll or non scroll operation
- TTY keyboard, or TTY keyboard with numeric pad, or upper/lower case keyboard with numeric pad, or upper/lower case keyboard with numeric pad, function keys, and cursor keys.

- 12 or 24 line display
- Bell on 70th character
- Normal or offset cursor address codes
- Normal or reversed video
- National character sets

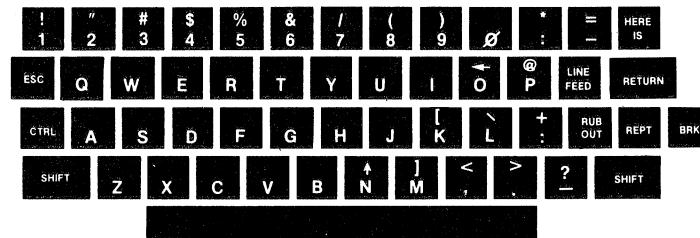

2. OPERATING INSTRUCTIONS

Before using your I200 on line we suggest that this section be read and understood.

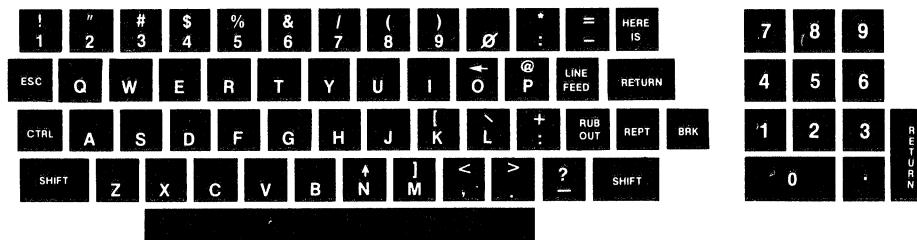

2.1 OPERATOR CONTROLS, FRONT

Operator controls and indicators which are located on the front of the terminal and on the keyboard assemblies are shown in Figure 3 and described below.

- POWER — In the ON position, the terminal is in the operating state and an indicator contained within the switch is illuminated. In the OFF position, power is removed from the terminal. After the switch is turned ON, a 30 second warm-up period is required before operating the terminal.
- LINE/LOCAL — Selects either local or on line mode of operation. In LOCAL, data and control are provided by the keyboard. The unit is automatically configured in the LOCAL COPY mode and no data is transmitted to the interface. In ON LINE, data flow to and from the terminal is permitted. On models 200/1 and 200/2 the status is determined by the position of the switch. On models 200/3 and 200/4 the status is indicated by illumination of an integral LED in the ON LINE position.

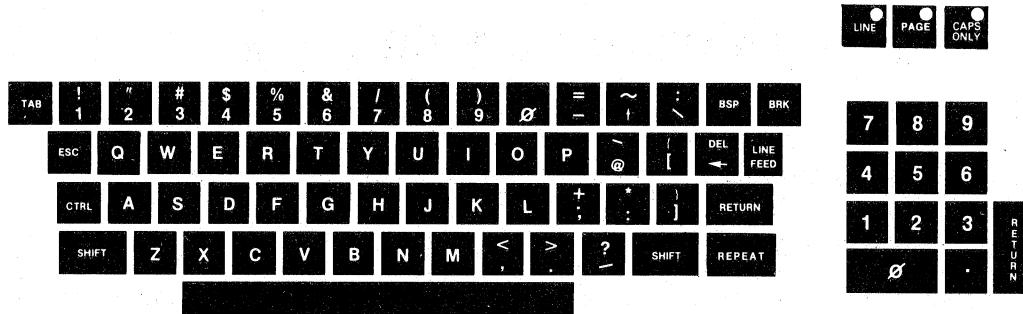

Model 200/1 STANDARD KEYBOARD

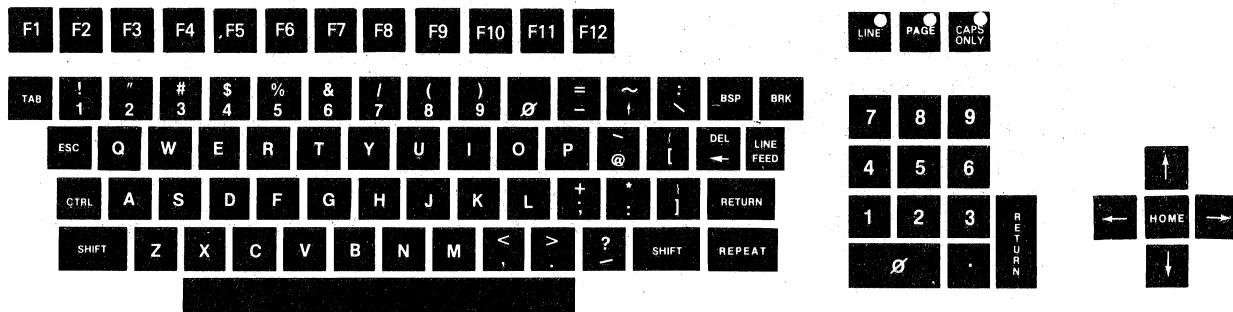

Model 200/2 OPTIONAL NUMERIC PAD KEYBOARD

Model 200/3 UC/LC NUMERIC PAD KEYBOARD

Model 200/4 UC/LC NUMERIC PAD FUNCTION KEY KEYBOARD

Figure 3 I200 Keyboard Layouts (Continued)

2.2 KEYBOARD AND CODE SET

The I200 terminal is controlled by a 7-bit ASCII code set, Figure 2, generated by the four keyboards shown in Figure 3, or received over the data line.

The 64 ASCII codes from 040g through 137g are entered into memory when received from the data line or from the keyboard (Local Copy). With the exception of the space code (040g); all of these codes result in the display of a character on the I200 screen.

The 31 ASCII codes from 140g through 176g (lower case), are stored in memory when received and are displayed as upper case characters when the lower case option is not installed.

**LINE
FEED**

LINE FEED - (from data line or from keyboard) — The LINE FEED command causes the top line of the display to be erased, lines 2 through 24 will be moved up one position, and the bottom line will be blank.

RETURN

RETURN - (from data line or from keyboard) — The carriage RETURN key places the cursor at the beginning of the bottom line (left margin).

**RUB
OUT**

RUBOUT - (from keyboard) — The RUBOUT key causes a rubout code (all ones) to be transmitted, no cursor movements occur and no character enters memory. Rubout codes received from the data line are ignored.

REPT

REPEAT - (from keyboard) — The REPEAT key, when held down while any other key is depressed, causes that character or function to be repeated at a rate of 10 characters per second.

BRK

BREAK - (from keyboard) — Depressing the BREAK key forces a "space" condition on the data line as long as the key is depressed.

SHIFT

SHIFT - (from keyboard) — The SHIFT key enables keyboard generation of symbolic characters (!, &, etc.).

CTRL

CONTROL - (from keyboard) — Depression of the CONTROL key allows the control code to be transmitted over the line.

ESC

ESCAPE - (from keyboard) — The ESCAPE key generates the ASCII code 023g. If received over the data line, it is ignored.

F1

Function keys transmit the code shown in Figure 2. These codes have no effect when received by the terminal.

PAGE^O

PAGE selects page mode when scrolling option is installed and is indicated by an illuminated LED. When non scrolling option is installed this key has no effect.

**CAPS^O
ONLY**

CAPS ONLY prevents the keyboard from generating lower case alphabetic characters only. All other functions are normal including the use of the shift key. CAPS ONLY mode is indicated by the illumination of an LED.

2.3 I200 TV MONITOR CONTROLS

The two operator controls which affect the TV monitor presentation are located on the underside of the front left corner of the terminal assembly as shown in Figure 4.

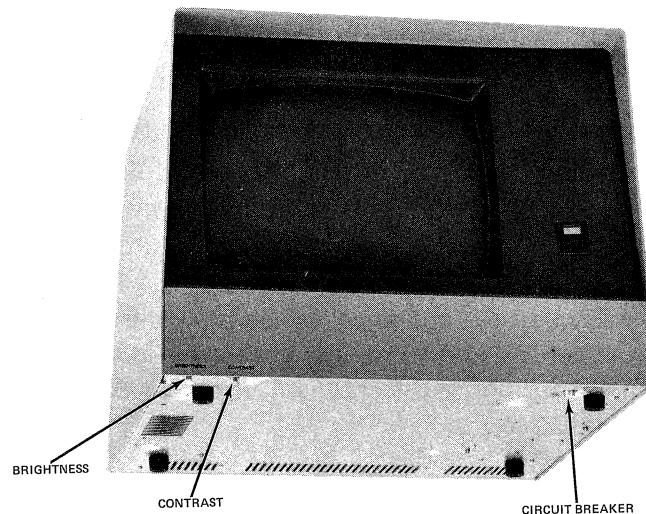

Figure 4 I200 TV Monitor Controls

2.3.1 Intensity

Allows adjustment of the brightness of the characters displayed.

2.3.2 Contrast

Allows adjustment of the contrast to provide image density control.

2.4 REAR PANEL CONTROLS

Interface controls, located on the rear of the I200 terminal, provide for customer interface connection and determination of related functions (data rate, parity, etc.), for the serial asynchronous EIA or current loop interface.

2.4.1 Data Rate Selector

This switch selects one of sixteen rates or External clock as shown in Figure 5. The EXT setting provides for handling data rates other than the sixteen rates listed. The external clock must be a TTL compatible pulse source cycling at 16 times the rate desired (maximum data rate is 20 kilobaud).

2.4.2 Parity

The parity switches determine both the transmit and the receive parity. In the EVEN position, the transmit character parity bit is selected to make the number of marking bits in the character even. The switch also configures the receive parity checking logic to check for EVEN parity. In ODD parity the transmitter transmits ODD parity and the receiver checks for ODD character parity. In MARK parity the transmitter always sends a marking bit for parity and the receiver does not check for parity. In Space parity the transmitter always sends a spacing bit for parity and again the receiver does not check for parity.

2.4.3 Local Copy

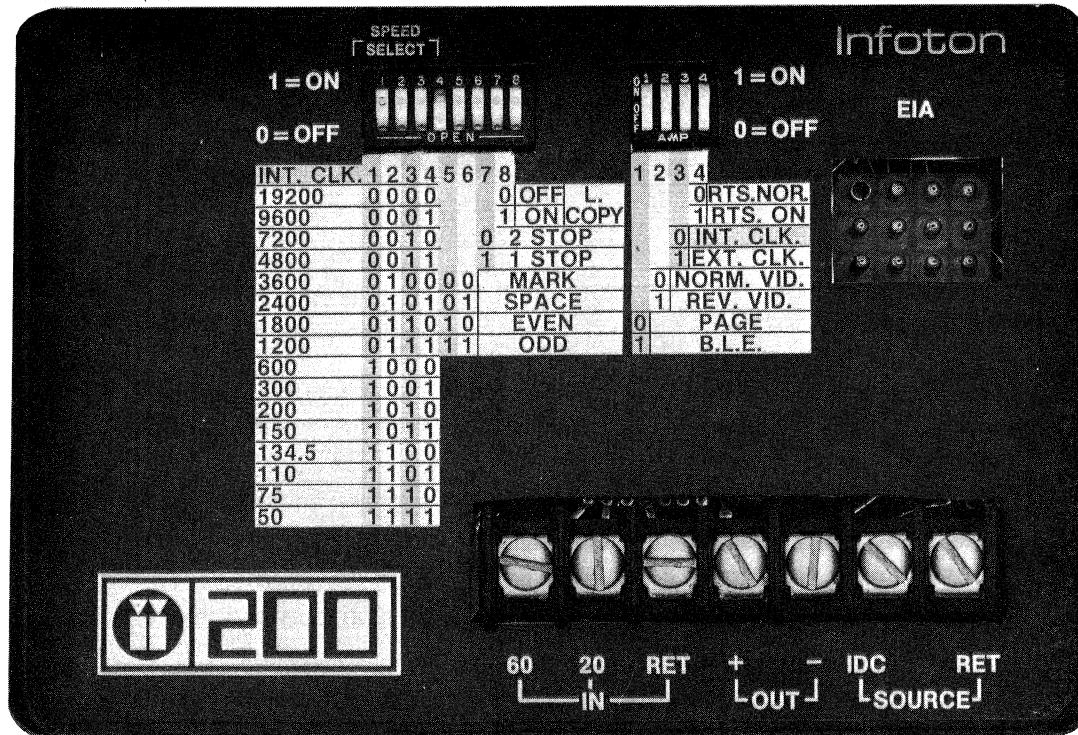

The local copy switch, when on, routes transmitted data back to the receiver in addition to sending it to the CPU. In the off position the transmitted data will appear on the screen ONLY when the CPU echos it back.

2.4.4 Stop Bits

The 1/2 stop bit switch determines the number of bits transmitted by the terminal to be either 10 or 11 (1 stop bit, or 2 stop bits). If the correct configuration is not known select 2 stop bits.

2.4.5 Request-to-Send

The R-T-S switch allows the Request-to-Send signal generated within the terminal and used on the EIA interface to be permanently on (RTS ON) or to cycle as each character is transmitted (RTS Normal). RTS On position is used primarily on a full duplex network and when using the current loop interface.

**Figure 5** Rear Panel Controls

2.4.6 Normal/Reversed Video

This switch determines the presentation of all data on the screen. In NORM position all characters appear as white dots on a black background. In REV position all characters appear as black dots on a white background.

2.4.7 Page/Bottom Line Entry

This switch determines the mode of the terminal scrolling option. When in the PAGE position Home is the top left of the screen and data entry proceeds from there to the bottom of the screen. In the BLE position data is entered on the bottom line only and the screen rolls up one line when the bottom line is filled. In BLE position cursor addressing is inhibited as the cursor can reside only on the bottom line. On models 200/3 and 200/4 this switch is inactive as the switching function is available on a keyboard key. When the non scrolling option is installed both this switch and the keyboard key are inactive.

2.4.8 EIA

The molex connector (Figure 7) provides I/O termination for use with INFOTON supplied modem cable. The cable is designed to be attached to a modem; however, it may be used directly with a computer modem interface. The I200 EIA interface specifications comply with EIA RS232 and CCITT V24 standards.

2.4.9 Current Loop Terminal Strip

A 7 pin barrier strip is provided to interconnect with the current loop interface. Either Full or Half Duplex operation may be used at either 20 or 60 mA. The source of the current is external to the I200. Figure 6 illustrates both Full and Half Duplex connections.

2.5 INITIAL SETUP

At the start of any operating period, we recommend that you follow these procedures before turning the terminal on line.

- Set the LINE/LOCAL switch to LOCAL, POWER switch to ON. The Power switch will then illuminate and approximately 30 seconds later a blinking cursor will appear on the screen.
- Check front and rear panel switches for proper position (data rate, parity, etc.).
- Type a message and see that it is correctly written on the screen. Exercise all functional keys to insure correct operation.
- Adjust INTENSITY and CONTRAST controls for your viewing comfort.

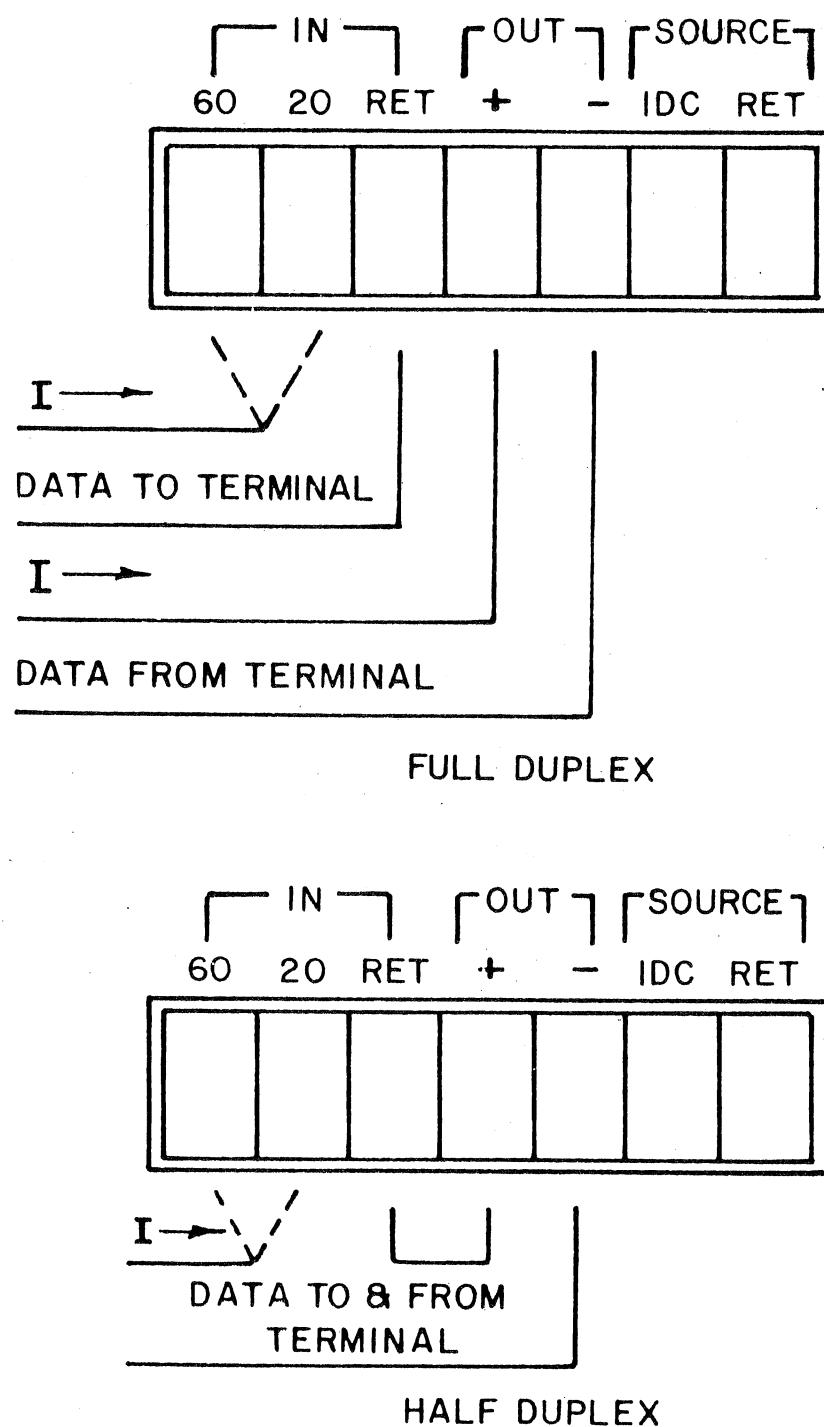

Figure 6 I200 Current Loop Connection

EIA RS-232C Name	CCITT V-24 Name	Description	Printer EIA Pin No.*	Modem EIA Pin No.	MOLEX Pin No.	Comments
BA	103	Data transmitted from terminal	—	2	1	Logical "1" = OFF = -12V Logical "0" = ON = +12V. 300-ohm source impedance.
CA	105	Request to send signal from terminal	—	4	2	Goes high (+12V) when the terminal is ready to transmit.
CB	106	Clear to send signal to terminal	—	5	3	Must be high to allow terminal to send; is supplied by a modem.
BB	104	Data transmitted to terminal	—	3	4	Logical "1" = OFF = -5V to -25V Logical "0" = ON = +5V to +25V 6.8K ohm load impedance
CF	109	Carrier present signal to terminal	—	8	5	Must be high to allow terminal to receive; is supplied by a modem.
CD	108.2	Data terminal ready signal from terminal	—	20	8	Goes high (+12V) when terminal is on LINE; is low when terminal is in LOCAL mode.
		External clock input at TTL logic level	—	—	10	For use with RECEIVE RATE selector switch in EXT position.
AB	102	Signal ground	7	7	12	
CC	107	Data set ready	—	6	7	Must be high to allow terminal to operate; is supplied by a modem.

Figure 7 EIA RS-232 Signals and Connector Pins

3. THEORY OF OPERATION

As an aid in maintenance of your I200 this section is provided to give the reader a basic feel for how their terminal functions. It is only intended as an aid in location of a problem to the sub-assembly level. Repair of subassemblies is not covered in this manual. This section is broken up into three parts; Keyboard Electronics, Logic Board Assembly, and TV Monitor.

The physical configuration consists of three major groups:

- TV Monitor
- Keyboard Switch Assembly
- Logic Board Assembly (Figures 9 and 10)
 1. Timing and Control Logic
 2. Memory
 3. Video Logic
 4. EIA Drivers and Receivers
 5. Current Loop Drivers and Receivers

3.1 KEYBOARD ASSEMBLY

The keyboard assembly uses a fully encoded Capacitive Scan technique. Seven bit ASCII codes are created with each key stroke without the use of switch contacts of any kind. Rollover features are incorporated which allow proper generation of codes as keys are struck even though one or more other keys are held depressed. Documentation on the keyboard will be found in the appendix.

3.2 CONTROL LOGIC PRINTED CIRCUIT ASSEMBLY (Figures 9 and 10)

The Control Logic PCB contains most of the components comprising the terminal.

3.2.1 Power Supply Portion

The I200 power supplies are contained on the Control Logic PCB and consist of four +5V supplies, a +12V supply, a -12V supply, and a +15V supply. Each supply except for the +15V supply has been implemented using 3 pin monolithic regulators. The +15V supply uses a conventional pass transistor in addition to the 3 pin monolithic regulator in order to provide sufficient power for the separate sync. TV monitor. Figure 10 indicates the test points for each supply output.

3.2.2 Interface Electronics Portion

The interface electronics provides a 20/60 mA Teletype compatible current loop interface, and an EIA RS232C compatible interface. Both operate in an asynchronous serial mode. EIA RS232C connector pin assignments and signal levels are defined in Figure 7. Both full and half duplex modes of operation are available. In addition, Mark, Space, Even, or Odd parity, the eighth bit, can be selected by the operator. Data rates are operator selectable. Eleven or ten bit code length at all data rates is also switch selectable.

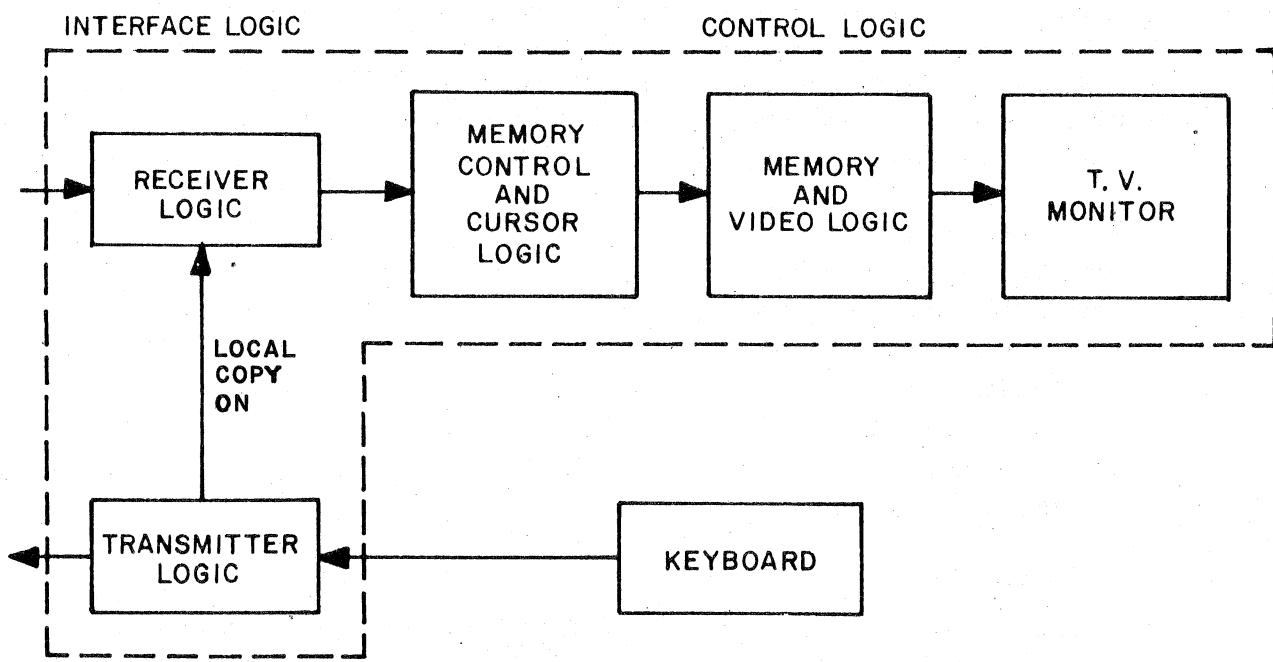

Figure 8 I200 Display Block Diagram

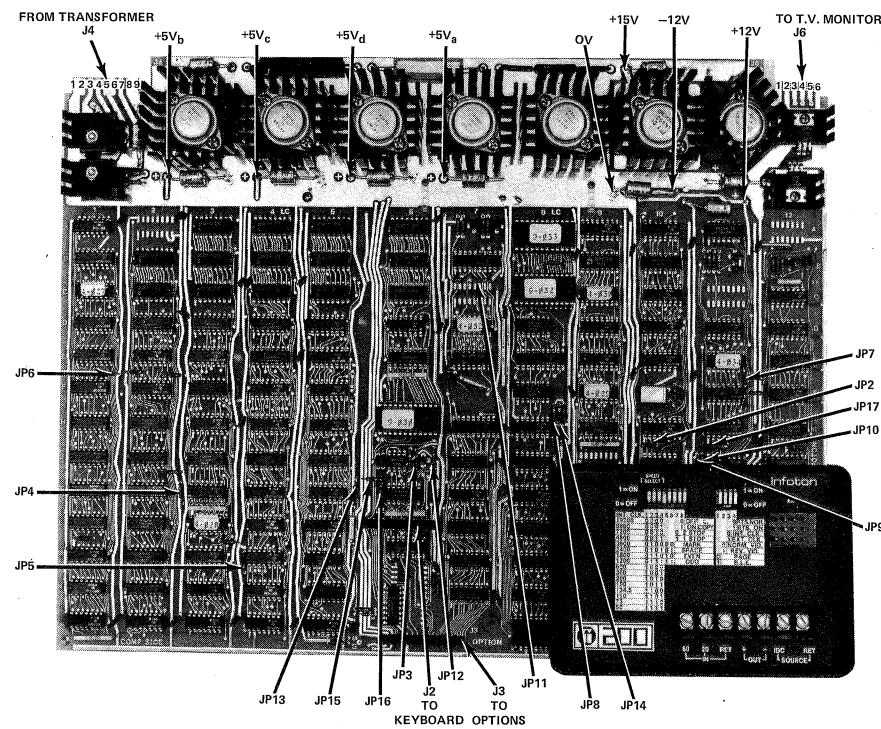

Figure 9 Control Logic PCB

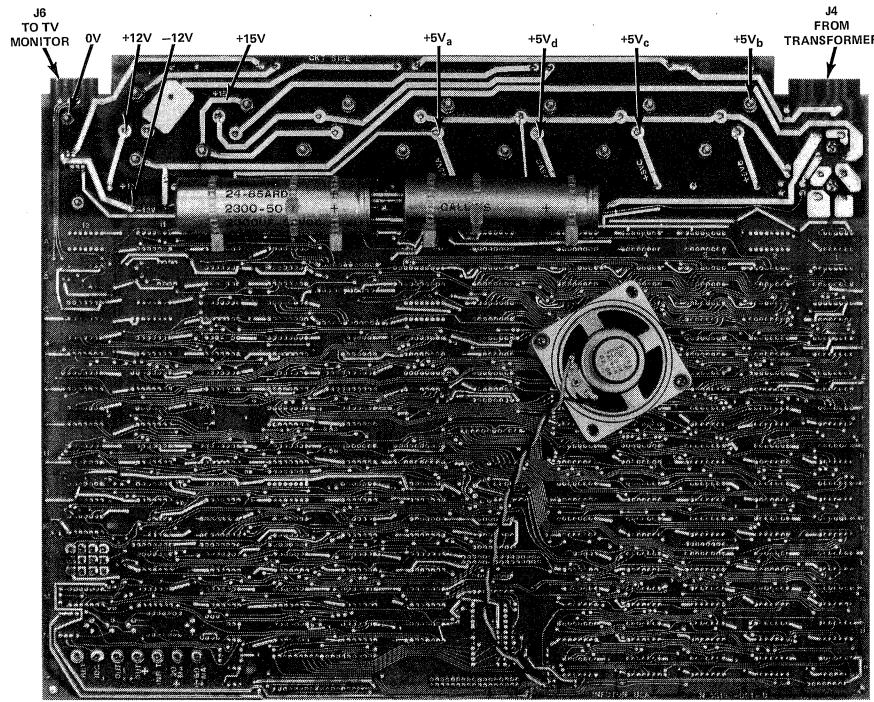

Figure 10 Power Supply Test Points

The asynchronous serial interface consists of a transmitter (parallel to serial converter) and a receiver (serial to parallel converter), (see Figure 11). Parallel data generated by the keyboard is converted by the transmitter to a serial bit stream. The bit stream is appended with a start bit, parity bit, and either one or two stop bits (10 or 11 unit code) prior to presentation at the transmit output.

Serial data at the receive input is stripped of start and stop bits, after which the parity bit is checked against the character parity and the status of the parity selection switch. The receiver converts the seven bit serial code to parallel, and forwards the character to memory.

Schematic diagrams of the I/O electronics and keyboard electronics are contained in the Appendix.

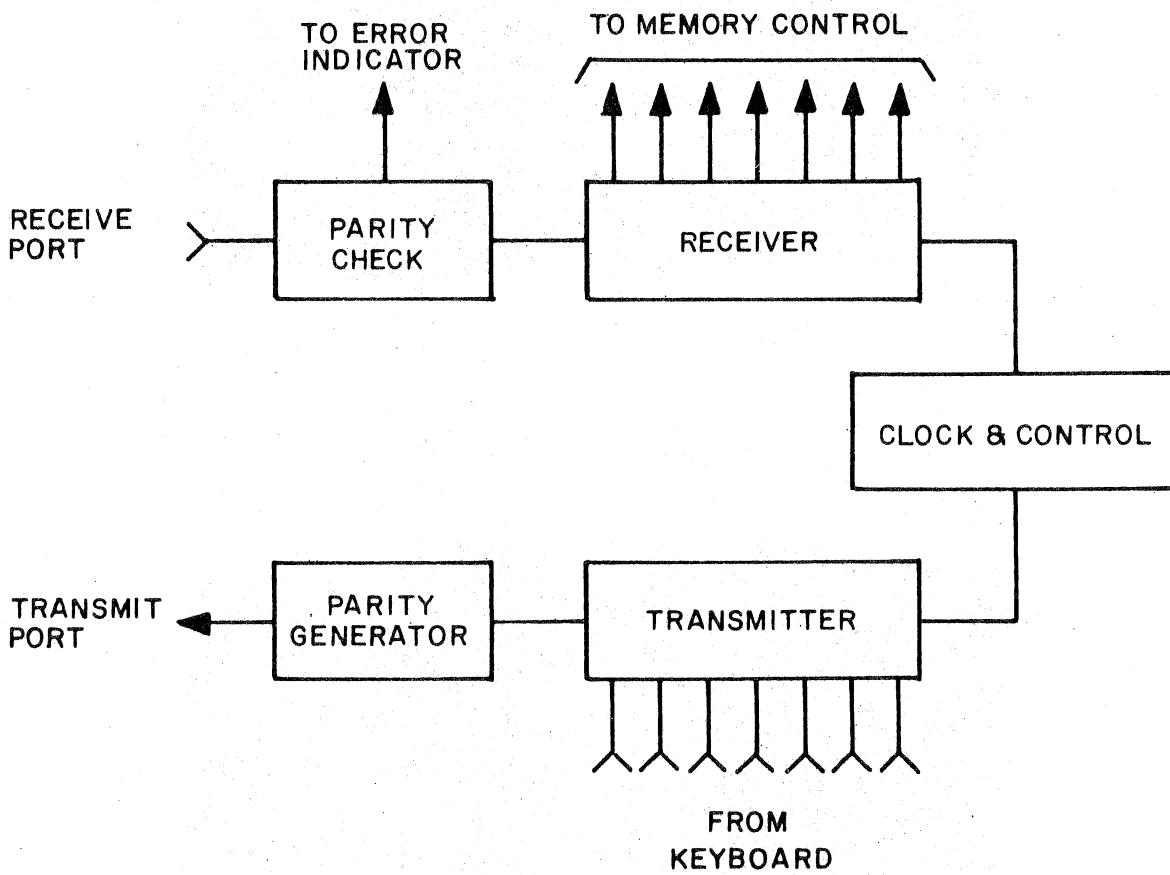

Figure 11 Serial Interface Block Diagram

3.2.3 Timing and Control Electronics

The timing and control logic provides complete timing for the display. The basic clock (24.024 MHz crystal oscillator) is used to provide the character dots to the video monitor. A divide by fourteen counter converts the basic clock to character clock. This clock is divided by 110 to form the character time (110 characters per line). The character time is then divided by 10 for 10 slices per character line. Last in the chain is a divide by 24 for

24 lines per screen. The character and line portions are used as memory address while refreshing the screen. In addition, other timing signals are derived from the basic clock to drive the read only memory (ROM) timing, vertical and horizontal sync for the monitor, and form the data rates used in the serial interface.

3.2.4 Memory

The data memory consists of two banks of 1024X7 bit RAM. During data storage the even display lines (L0, L2, etc.) are stored in the first bank while the odd display lines are stored in the second bank. Figure 12 illustrates these area assignments.

During erase and initialize operations the memory is configured in eight contiguous sections of 256 addresses each. For I/O operations each of these eight sections contain three lines of 80 characters each.

Absence of data in memory is represented by space codes and memory is filled with space codes during initialize and erase operations.

NORMAL OPERATION

ERASE PAGE AND INITIALIZE

Figure 12 Memory Configurations

3.2.5 Memory Control

Memory addressing is divided into two categories, I/O operations and Screen Refresh. The I/O operation is further divided into two categories, Erase and write data.

When erasing the screen and power on initialize, the memory is configured in 8 contiguous sections of 256 addresses. The character counter is allowed to count to a value of 255 before resetting and incrementing the roll counter. The roll counter therefore addresses each of the eight sections while the character counter addresses the locations within each section.

When writing a character into memory the character counter is allowed to count to a maximum of 79 and indicates the character position within the line. The line counter is added to the roll counter, the sum of which is offset to allow three 80 character lines within each section. This sum is then added to the character counter to form the absolute memory address.

When in Bottom Line Entry mode the effective line counter value is set to 23 by a multiplexer. The offset sum of the roll counter and line 23 in addition to the character counter form the absolute memory address.

When the non scroll version is selected the line counter logic is present, however the non scroll prom will not increment the roll counter, but will instead increment the line counter. The roll counter is held at a count of 8 (value after initialize or erase) and this is added to the line counter. Again this sum is offset and then added to the character counter to form the absolute memory address.

When not inputting a character into memory, the line and character counters are inhibited from becoming the memory address. The Line portion of the main timing chain is substituted for the line counter, and the character portion of the main timing chain is substituted for the character counter. A similar addition is made with the roll counter and again offset to form the address from which data will be extracted for display on the screen.

Note that the least significant bit of the effective line address is used as the most significant bit of the memory address, or bank select. This allows the second bank of memory RAMs to be removed when a 12 line display is desired.

The highest 16 addresses in each of the eight sections of memory, see Figure 12, are never used for data storage, however they are erased during initialize and erase operations.

3.2.6 Video Logic

Memory data is presented to two proms during refresh operation. Bits 5 and 6 from memory are decoded to determine whether the character is an upper or lower case code. The correct prom is then enabled and power is applied to extract the dot pattern. The prom output consists of up to 5 dots plus a control output. The dots are presented to the video shift register for serialization while the control output is used to determine the shift mode of the video shift register. If the control bit is a zero the dots associated with it are shifted out to the monitor 1/2 bit time earlier causing the presentation of those dots to be shifted to the left from their normal position. The presentation of curves within characters is thereby enhanced and produces effectively a 9 x 9 Matrix area rather than a 5 x 9.

3.3 AUXILIARY DEVICES

An Infotone is provided which sounds an audible tone when a bell code is received. Optionally the Infotone will also sound when the character counter passes the 70th position on a line. See section 4.4 for jumper location.

3.4 VIDEO MONITOR

The separate sync video signals generated on the control PCB are channeled to the video monitor. Detailed information on the video monitor is contained within the TV Monitor manual.

3.5 PRINTER COPY MODE OUTPUT

Through the use of the Optional EIA Cable Assy. PN 03157-G01 an EIA output is provided for printer operation. In line mode, Local Copy OFF, receive data is sent to the printer at EIA levels and at the data rate of the receiver. Keyboard data arrives at the printer by virtue of the CPU echoing the data.

In line mode, Local Copy ON, both receive and keyboard data are sent to the printer at EIA levels and at the receive-transmit data rate.

In local mode, keyboard data is sent to the printer at EIA levels and at the receive-transmit data rate allowing the operator to annotate the hard copy.

By use of internal jumpers, the copy function can be enabled and disabled from the data line by use of the DC1 (Print Copy ON) and DC3 (Print Copy OFF) codes.

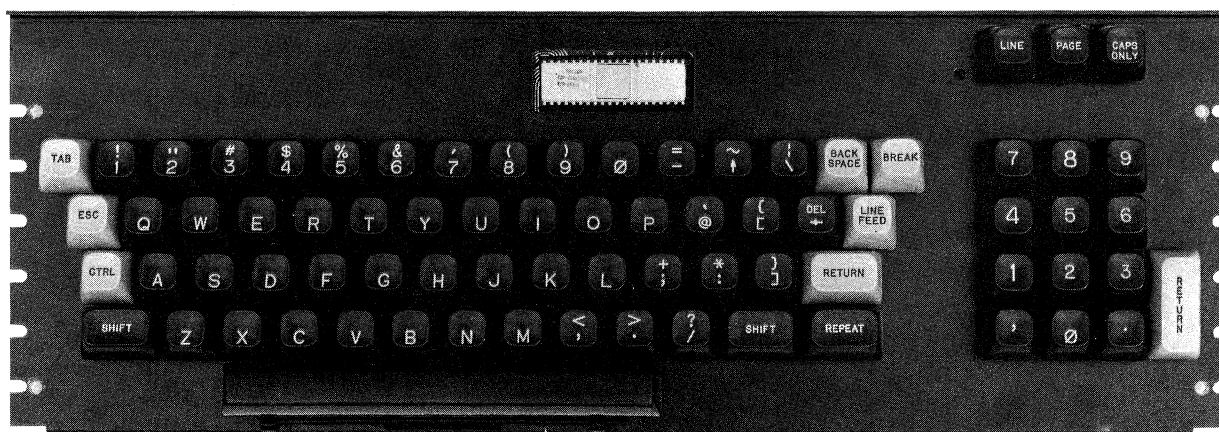

Figure 13 Keyboard Assembly

4. SERVICE

The INFOTON I200 terminal is a modular system that has been designed for ease in service. In addition to a high MTBF, the I200 terminal has a maximum time to repair of 30 minutes. Typically fault location and replacement takes 10 minutes. This section is intended to aid the service man in module replacement. Section 5 of this manual is devoted to troubleshooting and fault location.

4.1 MECHANICAL ACCESS TO THE UNIT

4.1.1 Removal of Cover (Figure 14)

- a. Remove two flat head screws from each side of cover
- b. Lift cover straight up and off.

4.1.2 Removal of the Control Logic PCB (Figure 15)

- a. Disconnect the two connectors from the top of the PCB
- b. Remove keyboard cable connector
- c. Remove the PCB

4.2 VIDEO MONITOR ADJUSTMENTS

With a screen full of H's, vertical size, vertical linearity, horizontal size, horizontal linearity, brightness, contrast, and focus adjustments can readily be made. Consult the appropriate supplement contained in Section 7 for the location of these controls. Best linearity can be achieved when the block of 1920 characters form a rectangle of from 7.5 to 8.5 inches wide (19-21 cm) and 5.5 to 6.0 inches high (14-15 cm).

4.3 POWER SUPPLY ADJUSTMENTS

The I200 is equipped with a general purpose power supply incorporating overvoltage protection and current foldback protection. Power Supply input is selectable as follows.

By Frequency

JP11 is installed for 60 Hz, removed for 50 Hz.

By Voltage

Figure 16 details the jumper connections for AC Input range selection. This terminal strip is located adjacent to the transformer.

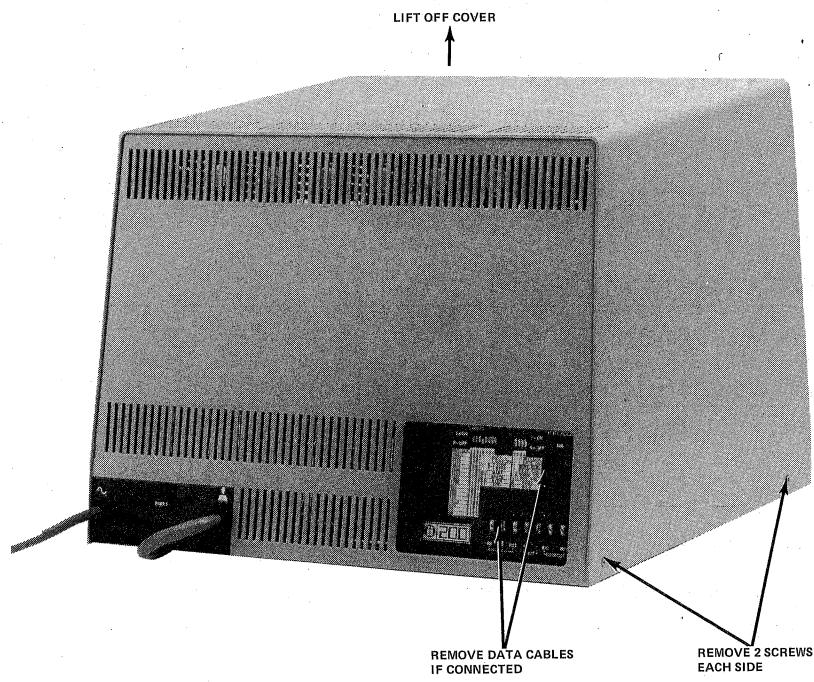

Figure 14 Cover Removal

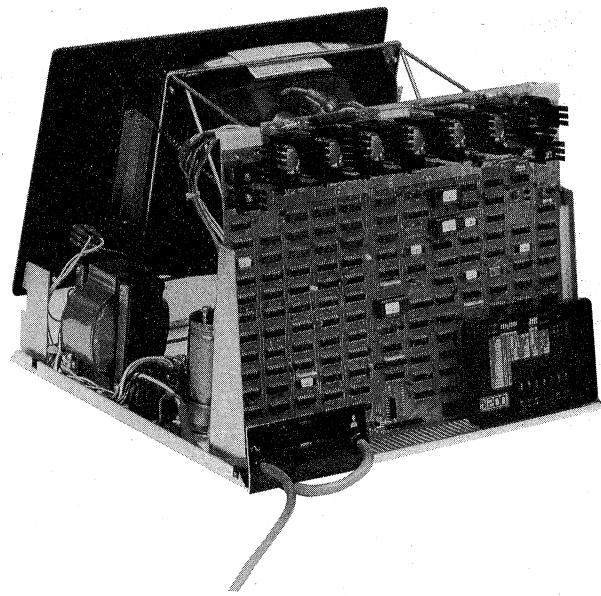

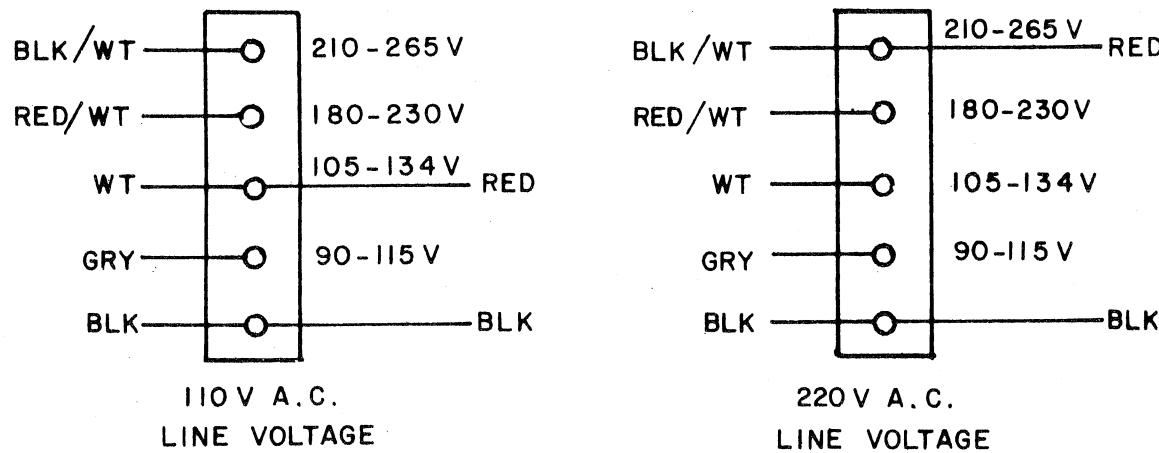

Figure 15 PCB Mounting

**Figure 16 AC Input Selection**

The proper tap is the highest voltage range which contains the value of the nominal line voltage.

The TV monitor receives its power from the +15 volt power supply. As a result there are no changes within the monitor due to line voltage or frequency changes.

4.4 OPTIONAL JUMPERS

The following chart details the use of all jumpers contained on the I200 Control Board Assembly. Jumpers are 10 ohm resistors in the locations shown in Figure 9.

Jumper	Functionality When Installed	Functionality When Removed
JP1	Nonexistent	Nonexistent
JP2	Permanent Roll Mode	Allow Keyboard or Rear Panel Roll Switch
JP3	Using U/L Case Keyboard	Using TTY Keyboard
JP4	Cursor Address 040_8 – 177_8	Cursor Address 000_8 – 177_8
JP5	Bell on 70th Character	No Bell on 70th Character
JP6	12 Line Display	24 Line Display
JP7	Upper Case Only	Upper/Lower Case
JP8	KBD "Caps Only" Key Present	KBD "Caps Only" Key Not Present
JP9	KBD "Rev. Video" Key Present	KBD "Rev. Video" Key Not Present
JP10	Using Rear Panel "Rev. Video" Switch	Using KBD "Rev. Video" Key
JP11	60 Hz	50 Hz
JP12	Using KBD "Roll" Key	Using Rear Panel "Roll" Switch
JP13	Not Used	Normal
JP14	Permanent "Caps Only" Mode	Normal

<u>Jumper</u>	<u>Functionality When Installed</u>	<u>Functionality When Removed</u>
JP15	Print Copy on Command Allowed	Print Copy On Comm and Ignored
JP16	Permanent Print Copy On	Allow Print Copy On Command
JP17	Rear Panel "Roll" Switch Connected	Rear Panel "Roll" Switch Not Connected

4.5 ORDERING REPLACEMENT AND SPARE PARTS

After determining the failure mode of the unit (see Section 5), a replacement part may be ordered by performing the following steps:

- Identify the terminal by name and serial number (see Figure 17). The serial number name tag is located on the bottom of your I200 terminal.

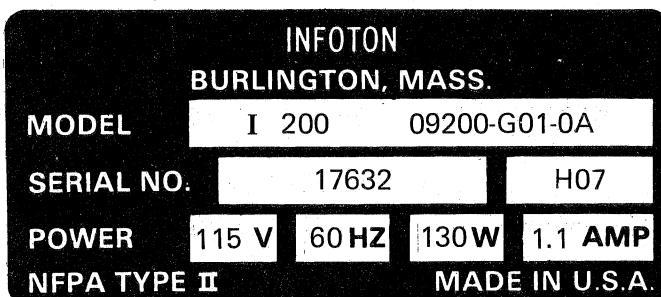

Figure 17 I200 Series Name Plate

- Identify the module by name and assembly part number (APN).
- Refer to the spare parts manual in Section 7 to find the proper part number when ordering parts.

If a question arises as to what is the correct part to order, write or call the Manager of Customer Engineering, INFOTON, INC., Second Avenue, Burlington, Massachusetts 01803; Phone: (617) 272-6660. Be sure to supply the terminal serial number as shown in Figure 16.

INFOTON maintains a complete product log of each unit in the field. The log is intended to aid the customer in acquiring proper service for his terminal. All factory authorized changes that are applied to a terminal in the field are entered in the product log. If a customer would like INFOTON to keep a record of authorized factory changes that he may apply to his terminal, he may do so by notifying the Manager of Customer Engineering, INFOTON, INC., in writing. Be sure to supply detailed information of the changes applied and the display serial number.

5. TROUBLESHOOTING AND FAULT LOCATION

5.1 I200 TERMINAL SELF CHECK

A feature of the I200 terminal is that it is capable of almost a complete self check when placed in the local mode of operation, all subassemblies of the I200 terminal are exercised. Only the serial interface is not fully exercised. The serial interface can be tested by operating the I200 on line with a turn-around plug, (APN 99999-022) Section 7, plugged into the EIA cable.

5.2 SUBASSEMBLY FUNCTIONS

Troubleshooting at the customer's site shall be limited to isolating the fault to one of the system's subassemblies. These subassemblies and their functional role in the system are described in the following paragraphs.

5.2.1 Keyboard Assembly (Figure 13)

- Capacitive switches and encoding logic producing parallel TTL codes
- Line/Local switch

5.2.2 Control PCB (Figure 9)

- Asynchronous Serial Interface
 1. Receives serial input data and converts it to parallel for presentation to memory.
 2. Receives parallel data from keyboard electronics and converts it to serial for data presentation to current loop and EIA output.
 3. Generates I/O direction and request signals.
 4. Contains interface clock source.
 5. Converts received EIA and current loop information to TTL logic levels.
 6. Converts transmit TTL information to EIA and current loop levels.
 7. Provides data rate, bits per character, FDX/HDX, and parity selection information.
- Timing Generator
 1. Clock Source
 2. Raster Generator
 3. Sync Generator
 4. Timing Signal Generator
 5. Memory Timing
- Control Logic
 1. Data Input Buffer
 2. Input/Output Control Logic
 3. Cursor Counter

- 4. Line Counter
- 5. Roll Counter
- 6. Cursor Comparator
- 7. Infotone
- 8. Control Code Decoding
- Video Generation
 - 1. Read Only Memory
 - 2. Parallel to Serial Converter
 - 3. Video Drivers
- Memory
 - 1. MOS RAM
- Power Supply
 - 1. Power Supply Active Components

5.2.3 Video Monitor

Combines horizontal sync., vertical sync. and serial video information for presentation on the CRT screen.

5.3 TROUBLESHOOTING

Because of the modular construction of the I200 terminal and its built-in self-test capability, troubleshooting is a relatively simple procedure. Most troubleshooting can be accomplished by viewing the CRT while exercising I200 terminal in local mode. The following additional equipment may be useful when troubleshooting a I200 terminal, especially when the trouble is associated with the particular system configuration in the on-line mode.

- General Purpose Multimeter
- Cross Coupler APN 99999-014
- Turn-around Connector APN 99999-022
- A second terminal (VISTA, VISTAR or VISTAR/GT)
- Oscilloscope Tektronix 453 or equivalent
- ASR 33 Teletype
- Spare set of Replacement Modules

5.3.1 System Test, Off Line (terminal in local mode)

Exercise the terminal from the keyboard, being sure to test all of its functions. Make sure data is loaded onto every line of the display, and that the top and bottom line is filled completely. The turn-around connector may be used by placing the terminal on-line, thereby exercising the entire transmitter and receiver.

5.3.2 System Test, On Line

Repeat steps outlined in 5.3.1 including all control codes recognized by the computer.

5.3.3 Power Supply Testing

Because of over-voltage and over-current protection of the I200 power supply, the symptom of power supply failure may be caused by problems listed below:

- Over-voltage crowbar. Turn unit off, then on again. The power supply should recover from this failure mode.
- Over-current protection causes the power supply to reduce output voltage when the current capacity of the supply is exceeded. This can be caused by a short within any module. To isolate this type of failure, simply unplug each module until the supply recovers. If all modules are removed and the failure still exists, check the PCB for contaminants bridging etched circuits. Replace the control PCB assembly if failure persists.

5.4 FAULT LOCATION

Since there is inherently some interaction between the modules within the terminal, it becomes difficult to pinpoint the defective module for all possible symptoms. In the following table typical failure symptoms, probable sources of trouble, and recommended repairs are listed.

Fault	Probable Source of Trouble	Recommended Repair
Pilot lamp not on; unit inoperable.	Unit not plugged in.	Plug unit in.
	Circuit breaker — Underside left front of unit tripped.	Reset circuit breaker.
	Faulty on/off switch.	Replace switch.
Pilot lamp on but no raster.	Brightness turned full off.	Turn up brightness control.
	Monitor fuse open.	Repair or replace fuse. See the TV Monitor Manual.
	Monitor not plugged in.	Check monitor cord in rear of monitor.
	One or more monitor connectors not connected.	Check connections. TV Monitor Manual.
	Terminal power supply defective.	Repair terminal power supply. See Section 4.
Raster but no sync.	Defective control module.	Replace control module.
	Defective video monitor.	Repair or replace video monitor.
Sync but no video pattern.	Defective control module.	Replace control module.
	Defective video monitor.	Repair or replace video monitor.
Noise on screen; sync poor or nonexistent.	Defective control module.	Replace control module.
	Defective power supply.	Replace control module.

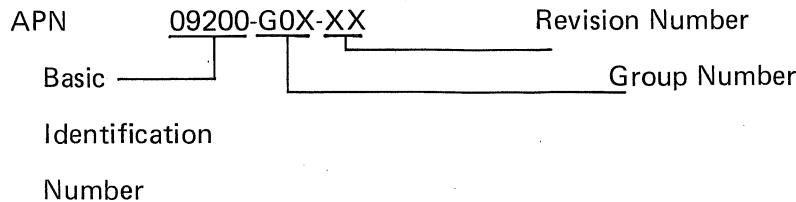

Figure 18 Fault Location

Fault	Probable Source of Trouble	Recommended Repair
Sync and video random characters; cursor may not be present.	Unit not initialized.	Turn unit off, wait 5 seconds, turn unit on.
	Defective control module.	Replace control module.
Characters broken or unintelligible.	Defective control module.	Replace control module.
Cursor but no cursor movement and no characters.	Defective control module.	Replace control module.
	Defective keyboard.	Repair or replace keyboard. Could be stuck key for a control character.
Cursor and characters but no cursor movement.	Defective control module.	Replace control module.
Cursor movement but no characters in system.	Defective keyboard.	Repair or replace keyboard. Could be stuck key.
Enters incorrect characters.	Defective control module.	Replace control module.
	Defective asynchronous serial interface drivers/receivers.	Replace control module.
	Defective keyboard.	Repair or replace keyboard. Character errors not bit-oriented.
Enters single character for all keys.	Defective keyboard.	Stuck key usually on key of character entered on the screen.
	Defective control module.	Replace control module.
Operable off line (local); not operable on line.	Defective asynchronous serial interface	Replace control module
	Defective control module.	Replace control module.

Figure 18 Fault Location (Continued)

6. DRAWINGS

The following drawings relate to the I200 terminal. Figure 19 shows the relationship between the module assembly numbers (APN 09200-G0X-XX) and the schematics.

The X's denote various generations of the basic module.

6.1 MNEMONICS LIST

6.2 SCHEMATIC MAIN LOGIC INCLUDING POWER SUPPLY (8 Sheets)

6.3 KEYBOARD SCHEMATICS (17 Sheets)

Title	Assembly Part Number	Schematic
I/O Logic	APN 03194-G0X-XX	03192-2, 3

DR. WJB	DATE 10/19/6		
APP.	DATE		
DWG. NO.			
36-0729			
REV.	DESCRIPTION	APP.	DATE
SHEET			

Requires 65-1466 Sheet 1, 35-1466 Sheet 1, and Oscilloscope.

A. SET-UP

1. Connect external trigger of the scope to the slowest bit on the counter (Z13-8). Adjust the sweep rate to one period of this signal (equivalent to one keyboard scan). When signal is located use intensify mode for viewing short pulses.
2. Ground both vertical inputs on the scope and set both base lines to the same reference levels. Set V/Cm to 1V/Cm.
3. Unground the inputs, you are ready to look at the signals on the keyboard.
Ref: Connect probe ground leads to ground near the point being measured.

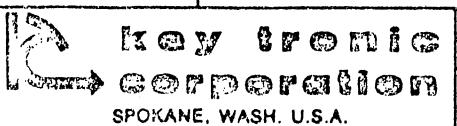

B. PROCEDURE

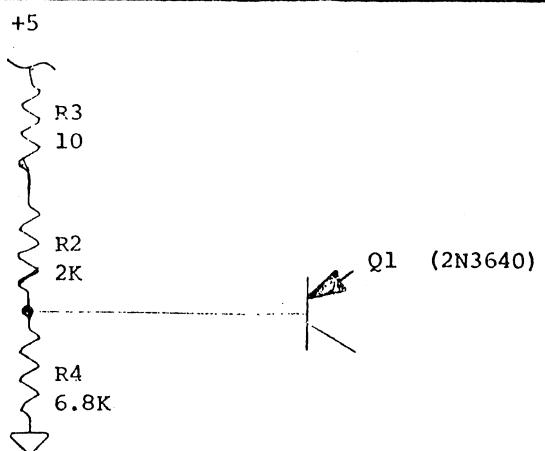

1. In order to verify that the fault is in the detector, connect probe "A" to the collector of Q2 (2N4274).
2. Repeatedly depress a key and ascertain if a negative pulse of approximately 1000 nsec is present (coinciding with key depression).
3. If negative pulses were observed, the problem does not lie in the detector and the validation and strobe processing logic should be checked.
4. If a negative pulse was not found at Q2, check the detector.
5. Before beginning to trouble shoot the detector, verify that Z11 (7442), Z17 (7442), and Z6 (4051) are working by checking inputs.

C. COMMON CHECKOUT

NOTE: After any changes to the circuit check the keyboard to ascertain whether the malfunction has been repaired.

1. Check to voltage level at the cathode of CR1 (IN5221B). It should be 2.1V. If the proper level is not present replace CR1. Verify that this level is also present at the base of Q4, if not, check trace for continuity.
2. Check the base of Q1 (2N3640) to verify the presence of a level of approximately 3.5V. If this level is not present verify continuity of the following circuit.

SCALE	TITLE		
TROUBLE SHOOTING KTC DETECTOR CIRCUIT			
	DR.	DATE	
APP.	DATE		
DWG. NO.			
36-0729			
REV.	DESCRIPTION	APP.	DATE

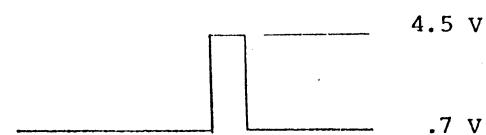

3. Verify that when a key is repeatedly depressed a corresponding negative pulse occurs at the base of Q1.

If no pulse occurs check R5 (1K) and CR2 (IN4148).

D. SIGNAL TRACING

1. Connect probe "A" to the base of Q3 (2N3640) and verify a positive pulse of approximately 500 nsec is present when a key is depressed.

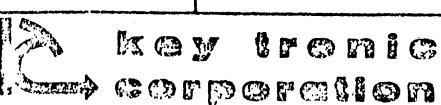

NOTE: Probe ground must be used throughout this section.

Replace Q4 (2N4274), Q5 (2N3640), R8 (4.7K), and C3 (220pf) if the pulse is not present.

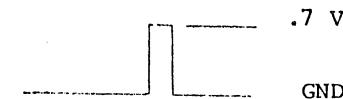

2. Connect probe "A" to the emitter of Q3 and verify the presence of a 1000 nsec positive pulse when depressing a key.

If the pulse is not present replace Q3 (2N3640) and R1 (1K).

REV.	DESCRIPTION	APP.	DATE
SHEET 3			

3. Connect probe "A" to the collector of Q1 (2N3640) and verify the presence of a 1000 ns positive pulse when depressing a key.

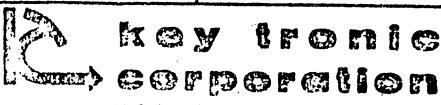

If the pulse is not present replace Q1 and R9 (10K).

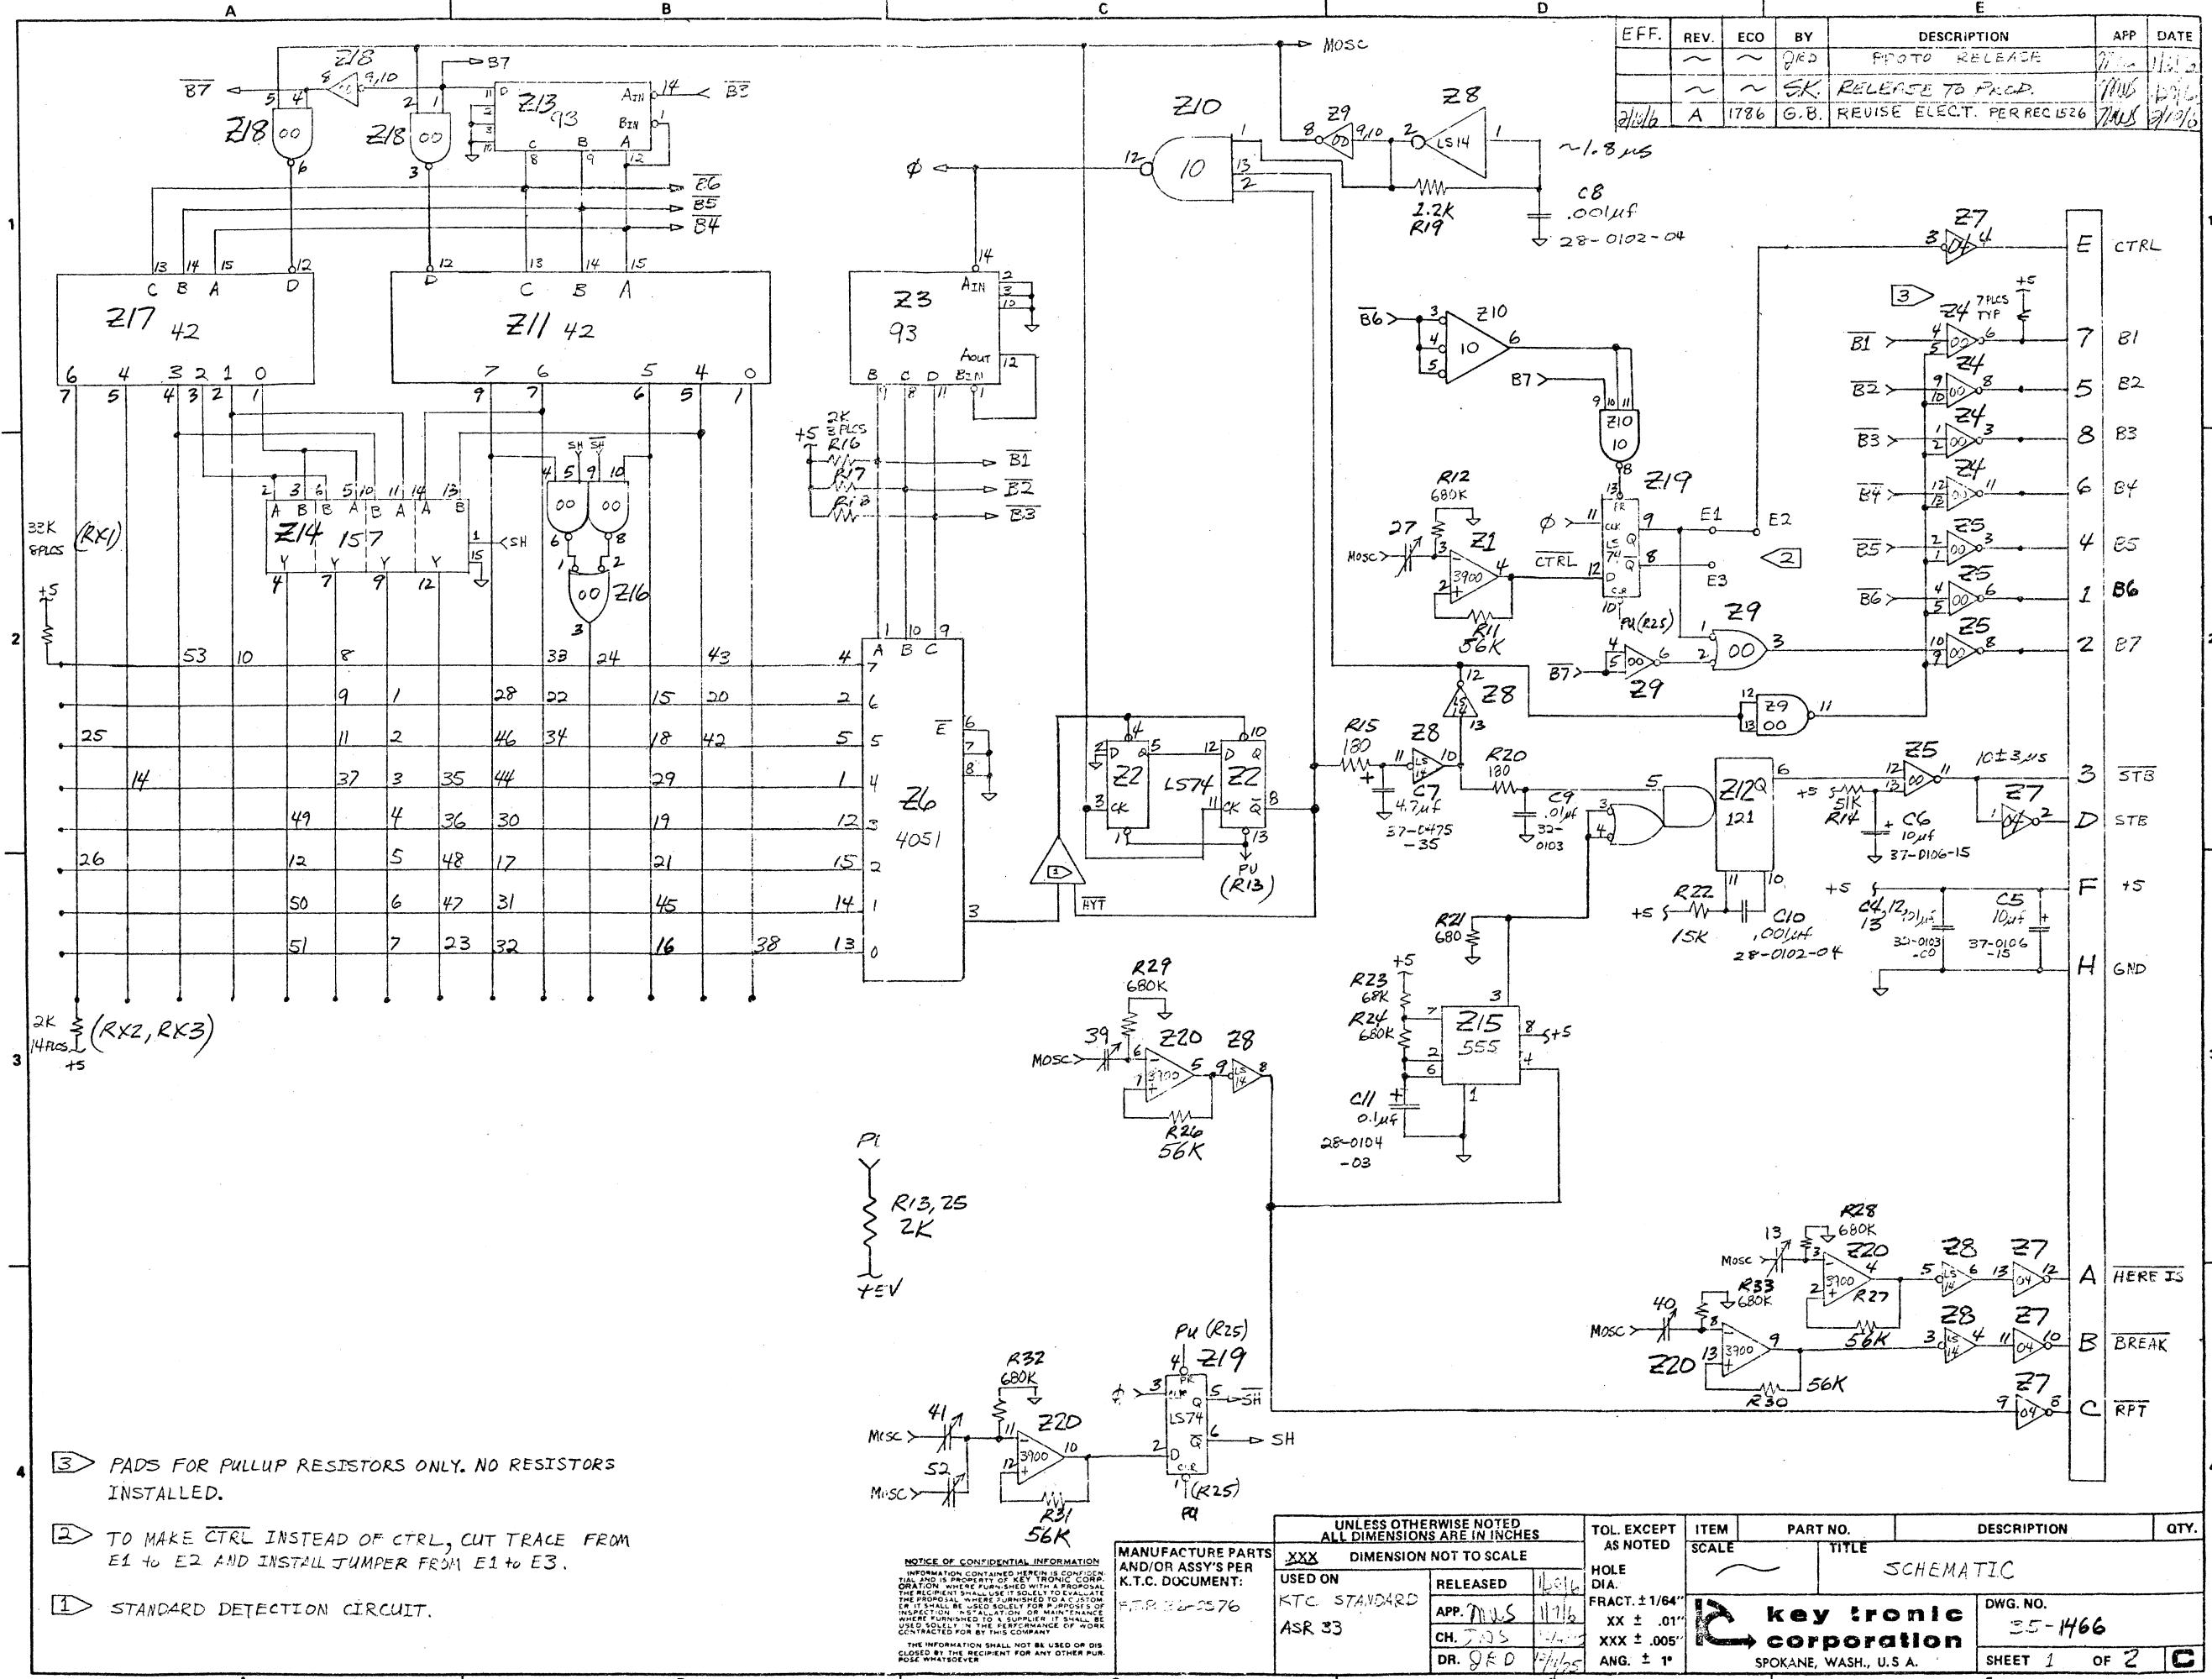

4. Connect probe "A" to the collector of Q2 (2N4274) and verify the presence of a 1000 nsec negative pulse when depressing a key.

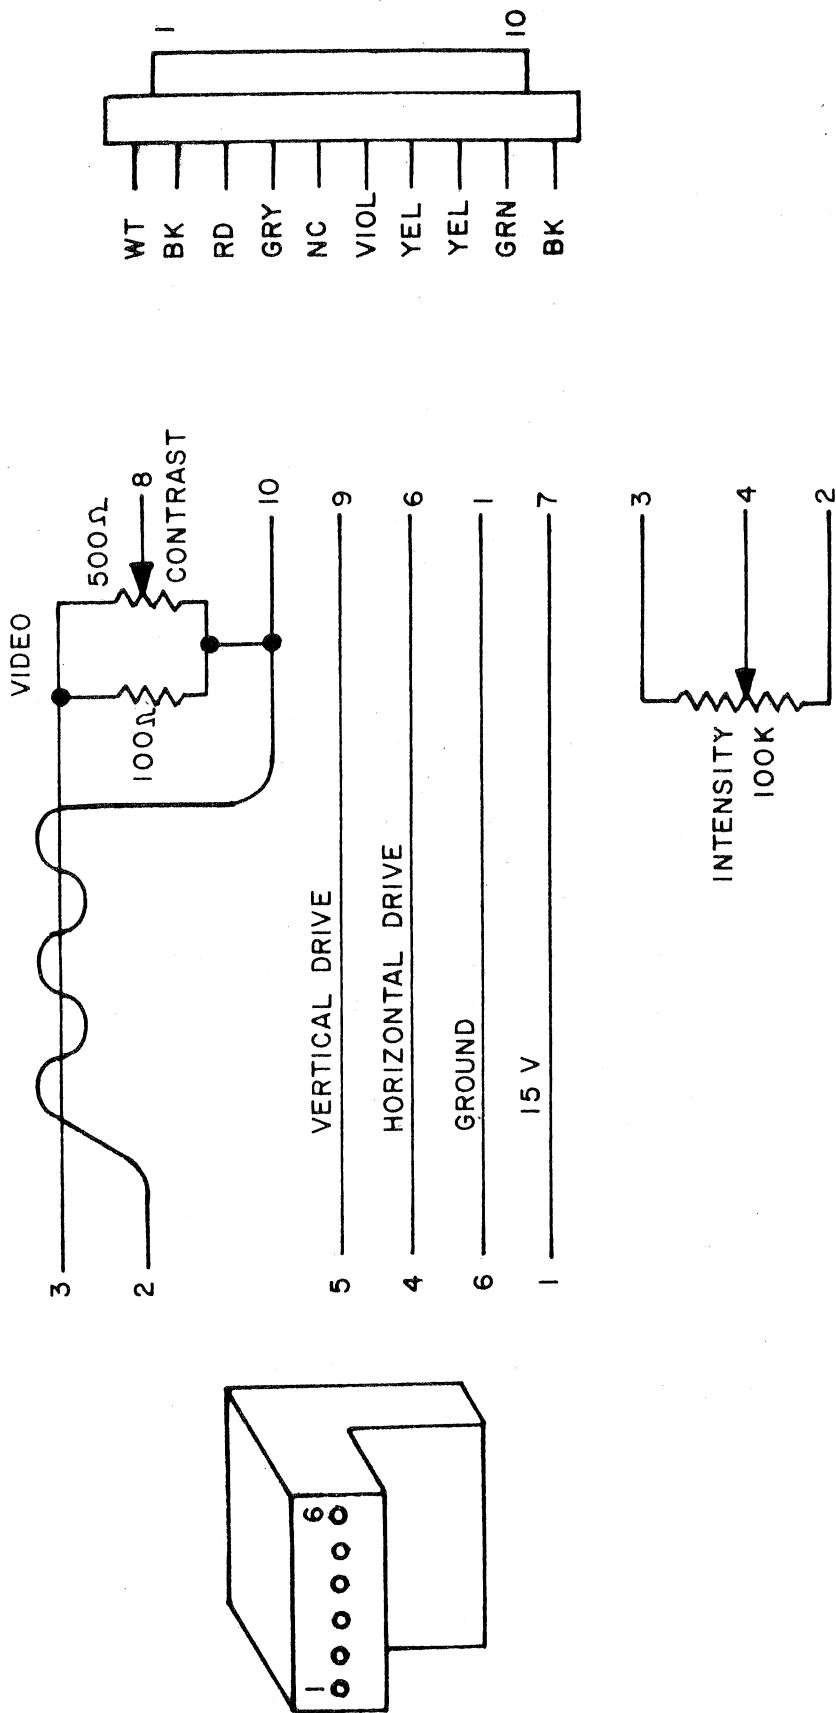

If the pulse is not present replace Q2 and R6 (10K).

5. This completes the checkout of the detector.
