

REVISION NOTICE

This publication replaces previous descriptions of "Matrix Vector Multiply 2," program D1-229.1. The program designations have been changed to current usage.

FUNCTION

"Matrix Vector Multiply 2" enables the user to multiply a matrix by a vector and store the resultant product vector.

INPUT

The following data must be supplied to the computer:

1. A matrix consisting of i rows and j columns, in floating point form, is stored consecutively (row major, column minor) beginning in location A_0 .
2. A column vector consisting of j terms in floating point form is stored consecutively beginning in location B_0 .
3. The Floating Point Interpretive System 1, program H1-24.0, is stored beginning in location F.
4. A calling sequence containing the following information:
 - (a) The location of program H1-24.0 (F).
 - (b) The initial location of the matrix (A_0).
 - (c) The number of rows (i) at $q = 23$, and the number of columns (j), at $q = 29$, in the matrix.
 - (d) The initial location of the vector (B_0).
 - (e) The initial location for the product vector (C_0).

MATRIX VECTOR MULTIPLY 2

CALLING SEQUENCE

<u>Location</u>	<u>Order</u>	<u>Address</u>	<u>Notes</u>
XXXX	R	Lo	Initial location of program D1-229.1
XXXX + 1	U	Lo	Initial location of program H1-24.0
XXXX + 2	Z	F	
XXXX + 3	Z	A _o	Reserve i x j location
XXXX + 4	Z	ij	i in track; j in sector
XXXX + 5	Z	B _o	Reserve j locations
XXXX + 6	Z	C _o	Reserve i locations
XXXX + 7	etc.		

OUTPUT

The elements of product vector C, in floating point form, are stored consecutively beginning in location C_o.

LIMITS

2 ≤ i ≤ 63 (i and j need not be equal)
2 ≤ j ≤ 63

TIME

.90ij seconds are required.

STORAGE

96 locations (1 track, 32 sectors) are required for storage of instructions and constants. No temporary storage is needed except as required by program H1-24.0.

Job No.

Prog. No. 29.1
