

DATA INPUT 13

TITLE: 6-Bit Floating Point Data Input Routine

AUTHOR: R.A. Koenig, National Lead Company
South Amboy, New Jersey

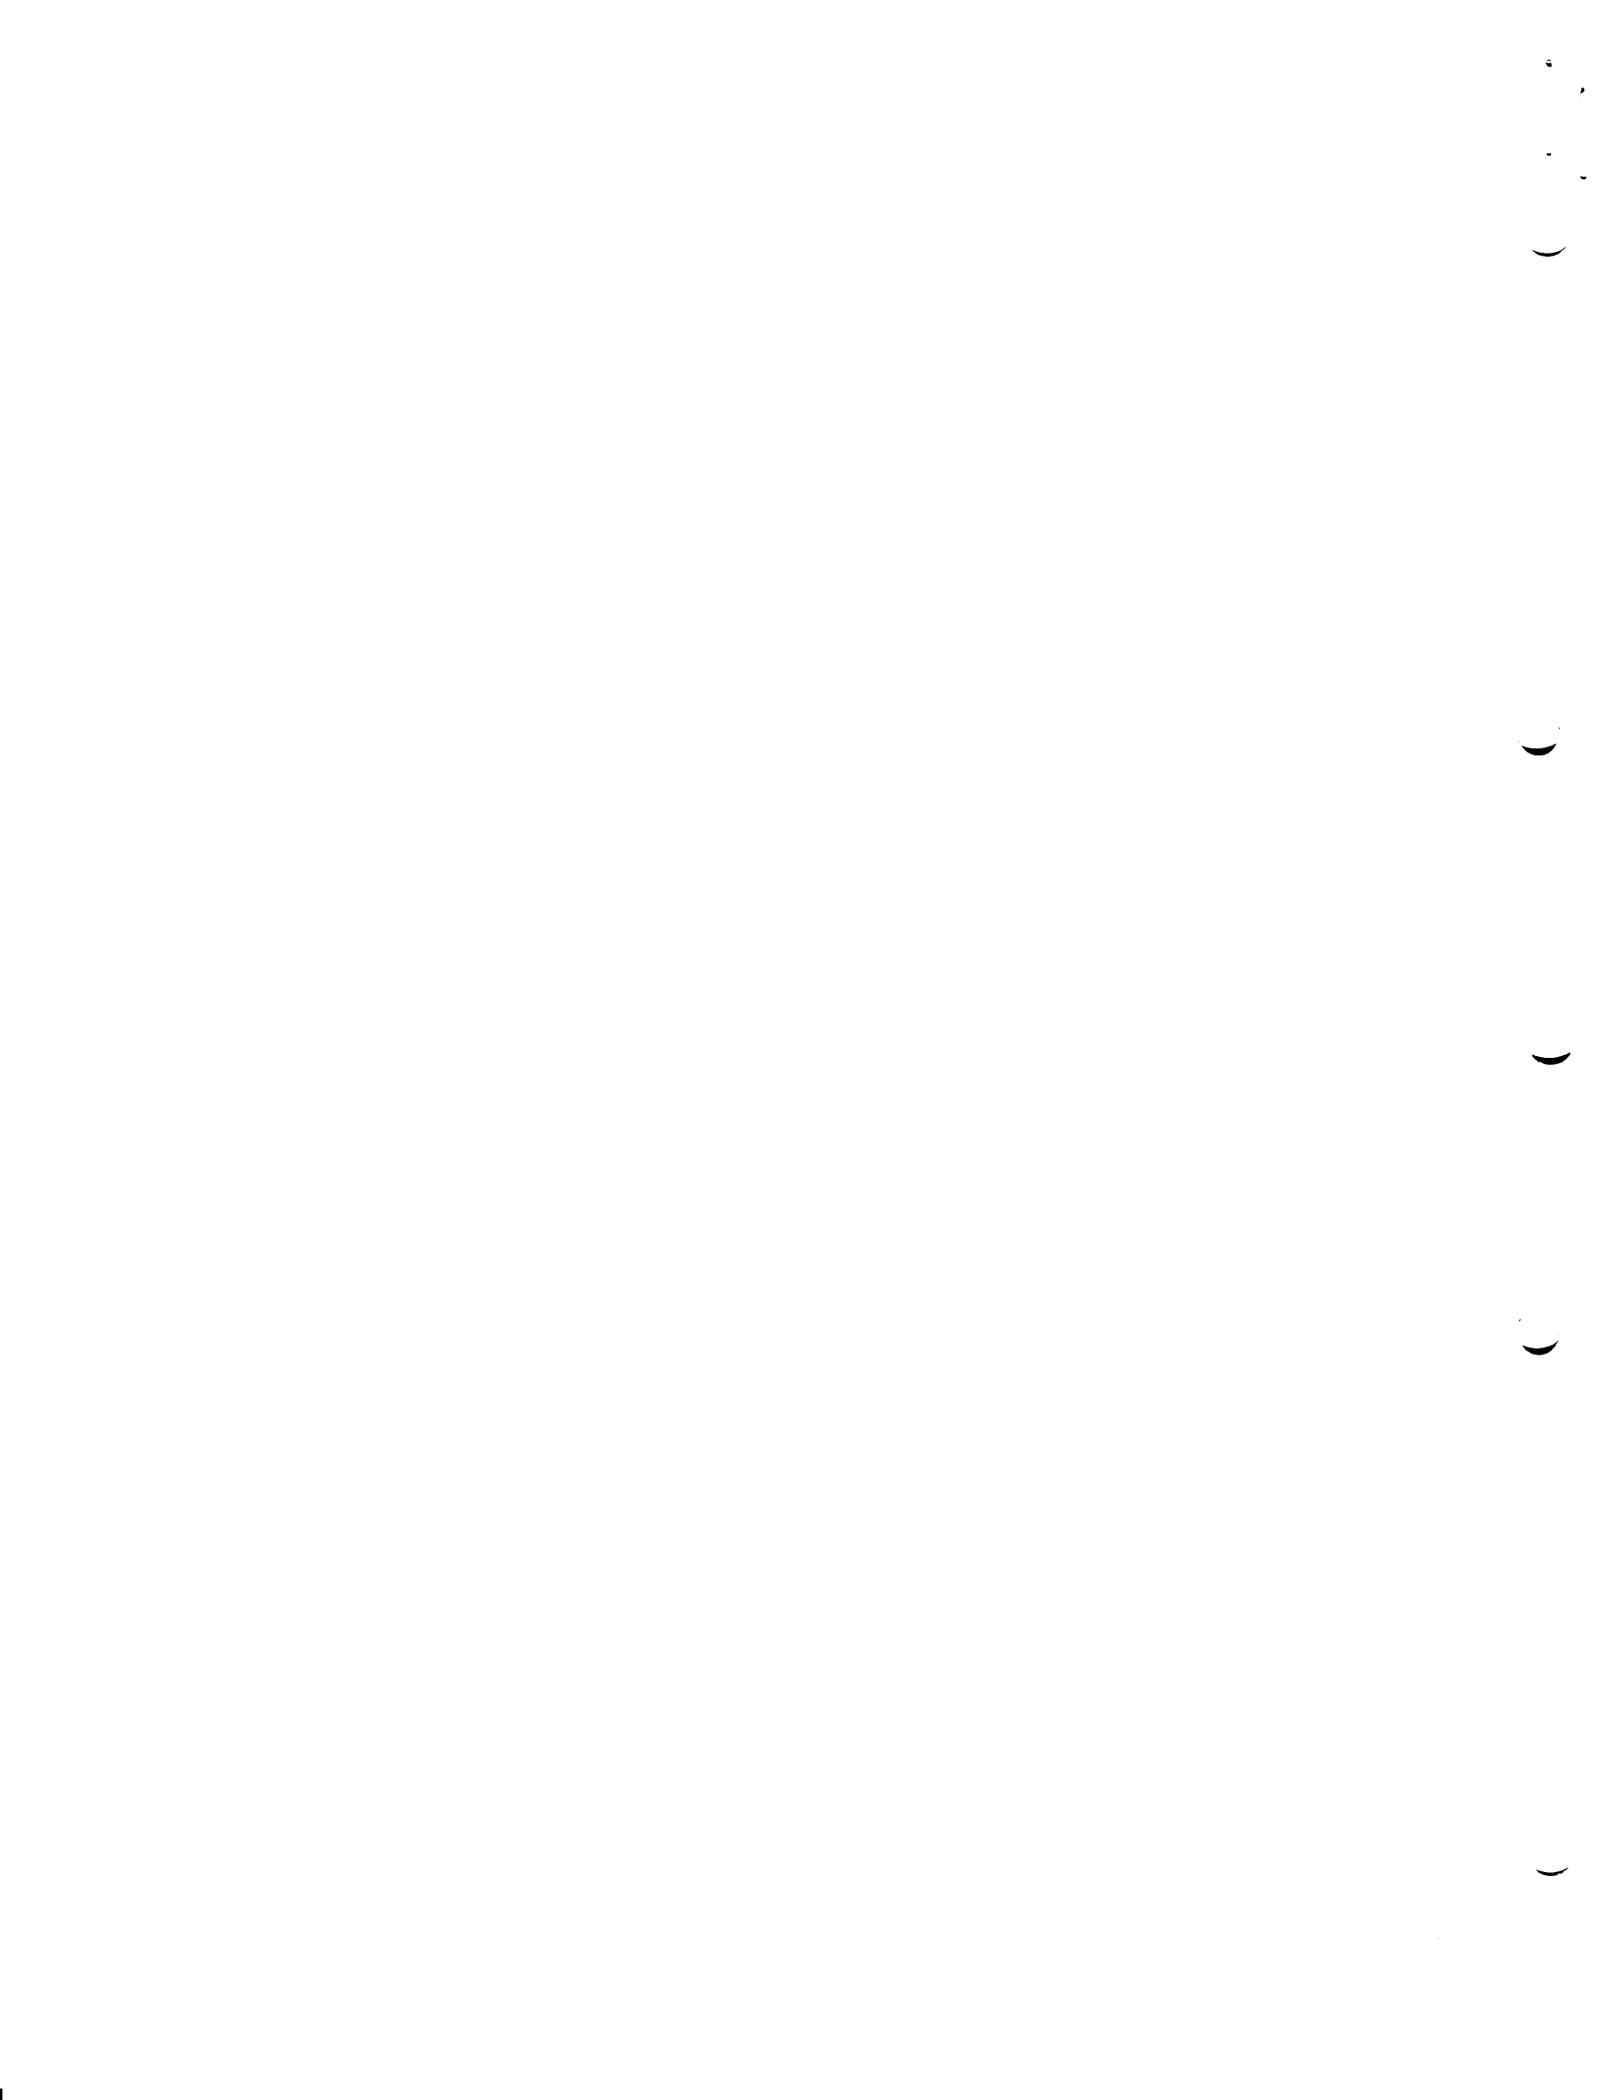

ABSTRACT:

This 5-track routine for use with ERF Format No. 2 will read in decimal numbers in 6-bit mode with the decimal point properly placed. The input consists of 9 decimal digits, plus the decimal point (and the minus sign, if negative) input as two 5-character words. If negative, the minus sign is included as a sixth character in the first word. There is no limitation as to the decimal point except that it lie within the permissible range of the ten characters. Accuracy of conversion is assured by a pre-scaling normalization of the numbers, thus permitting any relative position of the decimal point. The instructional words, "Group" and "Exit" have the same meaning as in Program 11.5. The output of the program is the number in floating point form stored in memory in two consecutive locations -- the first for the fraction and the second for the exponent.

A last minute addition to the program makes an automatic test for the position of the six-bit button. If not depressed, the program will refuse to continue.

DISCLAIMER:

"The authors of this program material, the POOL organization and Royal McBee believe this program to be correct; however, they bear no responsibility, financial or otherwise, for errors resulting from its use. This program is distributed only to individual and installation members of POOL. Further distribution of this manual and accompanying tapes for use by non-members is prohibited."

Title: 6-Bit Floating Point Data Input Routine

Author: R.A. Koenig, National Lead Company

Function:

The function of this routine is to input, convert, and store nine decimal digit numbers in proper floating point form of ERFP Format No. 2. To allow for direct placing of the decimal point, the six-bit input mode is used. This routine is compatible with ERFP Format No. 2 and can be used to replace Subroutine No. 11.5 if Format No. 2 is used.

Calling Sequence:

To use this routine, the following changes must be made to the ERFP routine (Prog. 24.1).

<u>Location</u>	<u>New Contents</u>
0900	Y 1560
0901	U 1446

This routine will not affect the contents of the floating point accumulator.

NOTE: If it is desired to take advantage of the two additional tracks available for data storage (this routine occupies five tracks as compared to seven tracks for Program No. 11.5), the following additional changes should be made to Program 24.1

<u>Location</u>	<u>New Contents</u>
0732	R 1847
0733	U 1663

Loading Sequence:

This program must be loaded as follows:

	<u>Start Fill</u>	<u>Set Modifier</u>
24.1	Lo	Lo
6-Bit Input	Lo + 1100	Lo + 1100

Input:

Three types of words are used by this routine.

- Initial address.
- First half of number or "group" and "exit" instructional words.
- Second half of number.

The initial address word is a 4-digit decimal address at which sequential storage is to begin. Sequential storing will continue until either an "EXIT" or "GROUP" word appears in the first half of the number.

The first half of the word can contain the following:

- "EXIT" - The reading of the word "EXIT" will cause a carriage return to be executed and the routine to return to the next sequential interpretative order following the IOOOO order.

- b. "GROUP" - The reading of the word "GROUP" will cause the routine to read a new initial address word.
- c. First half of number - The first half of a number can consist of five or less "acceptable" characters plus the minus sign if the number is negative. An "acceptable" character is defined as a decimal digit or the decimal point itself. If the number is positive, the positive sign must not be used. In the event that the number is negative, leading zeroes must be supplied. (See examples below.)

The second half of the word consists of five or less acceptable characters, as defined above.

Data Tape Preparation:

Any number containing nine decimal digits, plus the decimal point (and with a minus sign, if negative), is acceptable. These ten acceptable characters are read in two 5-character words.

Example: It is desired to place the following numbers into the specified locations.

Number	0.0	0.1435	768.976456	-0.000465712	100.0	100,000,000
Location	6200	6202	6204	6206	6220	6230

12.35	-4.0	.000000001	-60.00
6232	6234	6236	6250

DATA LOAD SHEET

Address Word				Stop	+	First Word					Stop	Second Word					Stop
6	2	0	0	'							'						'
						.	1	4	3	5	'						'
						7	6	8	.	9	'	7	6	4	5	6	'
					-	.	0	0	0	4	'	6	5	7	1	2	'
						G	R	O	U	P	'						
6	2	2	0	'							'	1	0	0	.	'	
						G	R	O	U	P	'						
6	2	3	0	'		1	0	0	0	0	'	0	0	0	0	.	'
											'	1	2	.	3	5	'
					-	4	.	0	0	0	'						'
						.	0	0	0	0	'	0	0	0	0	1	'
						G	R	O	U	P	'						
6	2	5	0	'	-	6	0	.	0	0	'						'
						E	X	I	T	'							

(Read New Address)
 (Read New Address)
 (Read New Address)
 (Read New Address)
 (End of Input)

Note: Words consisting of all zeroes need not be punched. A Stop Code is sufficient. The number zero can be input by using two Stop Codes.

It is immaterial to the accuracy of conversion as to the relative position of the decimal point. For example, the number 12.34 can be punched in any of the following ways.

12.34' ' 12.3'40000' 12.'34000' 12'.3400'
 1'2.340' '12.34'

Similarly -12.34 can be punched as:

-12.34' ' -012.3'40000' -0012.'34000' -00012'.34000'
 -00001'2.340' -00000'12.34'

Note that leading zeroes must be supplied for the negative situation.

-4-

Special Notes:

If the number consists of five or less characters (4 digits plus decimal point), the routine will load faster if these are in entirely the first word. The reason for this is discussed in the section on conversion method used.

Storage:

5 tracks of instructions and constants.
The following sectors of Track 63 are used as temporary storage.
00, 01, 02, 04, 05, 06, 07, 08, 10, 20, 21, 22, 27, 31, 32, 35,
37, 40, 43, 44, 47, 50, 63.

Time: Approximately 30 words/minute.

Accuracy: Integers are converted exactly.
Fractional numbers will be in error by less than 1 in the 29th bit regardless of relative position of decimal point.

Method of Conversion:

To guarantee maximum accuracy in conversion of the number, a normalizing operation is used. After binarization at $q = 30$ is completed, a normalizing loop is entered (provided $N \neq 0$). Since N is a nine-digit number is must be $< 10^{10}$. The normalizing routine scales N such that $8 \times 10^7 \leq N < 10^{10}$, counting the number of multiplying shifts (by 10 at 31) required to do this. Call the number of left shifts R and the resulting shifted number N^* . Having already determined P ($0 \leq P \leq 9$), N^* is scaled by two successive divide operations -- one to account for P , the decimal point location and the other to account for the R shifts. By this method, therefore, a number such as 0.1 will be accurately converted regardless of the position of the "." and "1" within the two words. If the significant characters are all placed in the first word, the R loop will not require as many iterations; hence the routine will require less time than if the significant characters are all placed in the second word. All numbers are standardized prior to storage. The number zero is represented as zero fraction and zero exponent.

Special Applications:

This routine also contains a special one word fill that leaves the fractional part of the number in Lo and the exponent (at 29) in $Lo + 1$. This can not be used in conjunction with ERFP system.

The calling sequence for single word fill is:

RO460

UO461

-5-

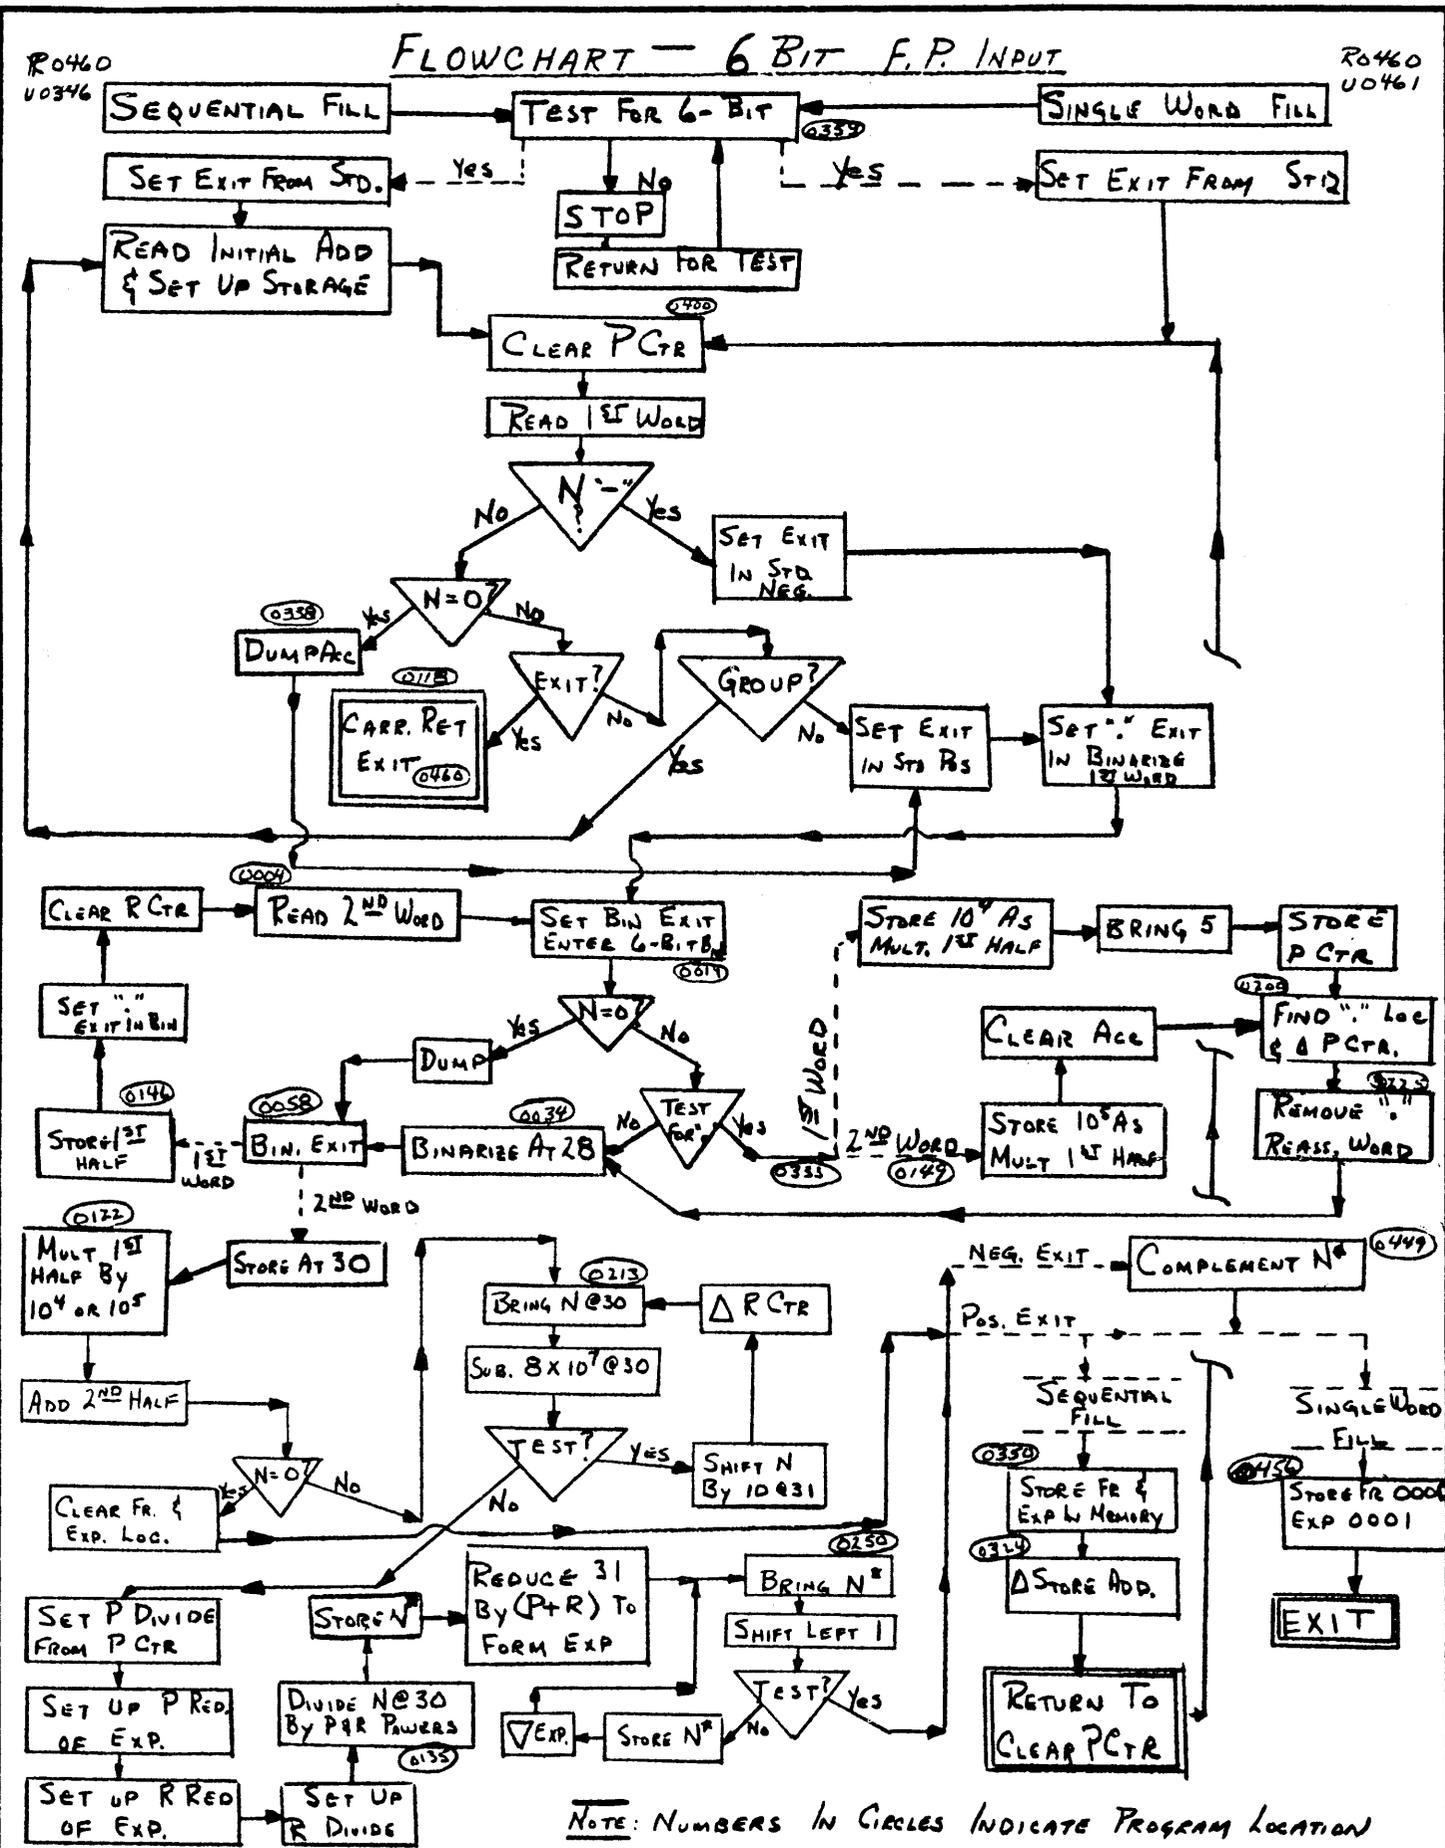

Using this mode operation, only the two halves of the number are used as input. Upon completion of storing the fraction in Lo and exponent in Lo + 1 the routine will exit.

Program Stops

0244 6-bit button not depressed. Depress 6-bit button and press start to continue.

Addenda

A programmed check for depression of 6-bit button has been included in the program. The effect of this is to give a dummy print order followed by an I0000 and testing the amount of shifting caused by the I order. (This was adopted per a suggestion from J. Rayna of Lehigh University.) All necessary changes have been made in the coding sheets and tape copies.
