SECTION I

INTRODUCTION

1-1 SCOPE OF MANUAL

This manual describes the Sigma 5 and 7 interrupt diagnostic program. General information regarding various subroutines is included so that, by using the text of the manual and the program listing, diagnostic techniques such as address SYNC may be implemented.

Loading and operating instructions are included, as well as a complete assembly listing. Also included is a list of publications from which more detailed information on related subjects can be obtained.

1-2 PROGRAM OBJECTIVES

The purpose of this program is to test the Sigma 5 and 7 interrupt system for various failures and to report the results of these tests. Specific tests verify whether each interrupt level presents the correct address to the CPU, verify the priority of the levels implemented, and make running checks to assure that failing conditions of an

intermittent nature do not go undetected. Conditions that are considered failures are as follows:

- a. Unexpected interrupts
- b. Expected interrupts that fail to occur
- c. Interrupts that present addresses outside the range X'50' through X'13F'
- d. Interrupts that occur out of priority sequence
- e. Interrupts that occur more than once per trigger.

Overseer-type checks are used wherever possible to detect conditions such as a. an interrupt level breaking into the active state of the highest priority interrupt implemented, or b. an interrupt level presenting an address within the current register page.

1-3 GENERAL SPECIFICATIONS (See table 1-1)

Table 1-1. General Specifications

Computer Configuration	Sigma 5 or 7 computer with 8K words of memory
Required Equipment	A card reader or paper tape reader; a KSR/ASR printer
Optional Equipment	None
Prerequisites	The AUTO diagnostic must have been run error free
Storage	8K words
Source Language	Metasymbol
Program Media	Paper tape or cards

SECTION II OPERATING PROCEDURE

2-1 PROGRAM LOADING PROCEDURE

The standard fill procedure is used to load program. See page 2 of the program listing, page 4-2, for successful load indications.

2-2 LOADING OPTIONS

This program should be run with the WATCHDOG TIMER switch set to NORMAL, the PARITY ERROR MODE switch set to CONT, the ALARM switch ON, and SENSE switches 1 and 2 at 0, at least until the program is loaded.

2-3 SUCCESS/ERROR INDICATIONS

If a watchdog timer trap occurs, an error interrupt from X'46' will be indicated. If a memory parity error occurs, an unexpected interrupt from X'56' will occur. If error printing is suppressed by setting control bit 0 to a one, the ALARM will go on each time a failure is detected. If very few or highly intermittent failures occur, the alarm indication may not be visible or audible.

If SENSE switches 1 or 2, or both, are set to 1 as the program is loading, waits will occur in the load process, as described in the diagnostic loader manual (No. 900972).

2-4 PROGRAM OPERATING PROCEDURE

After loading, the program runs as follows:

- a. The address of every interrupt that responds to a WD instruction is verified.
- b. The sequence of priorities is determined and the following checks are made:
 1. All interrupts that occurred during the address test occur during this test.
 2. No interrupt occurred during this test that did not occur during the address test.
- c. During tests a and b, above, overall checks, as described in section I, paragraph 1-2, c and e, are carried out.
- d. The priority of interrupts received (step b, above) is printed out on the KSR/ASR printer and verification or correction must be made by the operator.

e. After verification or correction of the priority sequence, a basic test of the entire interrupt system is carried out with all patterns tested under all eight combinations of the inhibit bits in the PSD.

The patterns can be: All levels armed-disabled, triggered, and enabled, all levels armed-disabled, triggered, even numbered levels enabled, all levels armed-disabled, triggered, odd-numbered levels enabled, all levels armed-disabled, even numbered levels triggered, all levels enabled, and so forth.

This pattern of "all", "odd", "even", even-odd pairs, and odd-even pairs, is continued for all 343 combinations of X'FFFF', X'5555', X'AAAA', X'9999', X'CCCC', X'3333', X'6666', taken three at a time with all checks made.

f. A routine is then entered that generates every possible combination of armed-disabled, triggered, enabled, inhibited, and not inhibited condition that can occur within the interrupt system implemented. It is not expected that this routine will be allowed to cycle, even complete one pass, on a machine with many interrupt levels implemented, since the run time increases by binary powers with each additional interrupt implemented.

The run time for a given number of patterns can be reduced considerably by setting SENSE switch 1 to ON. This causes a bypass of tests for optional functions, such as setting control bits, entering routines, and so forth.

This pattern generator function is included to allow detection of highly intermittent failures or failures that occur only under unique conditions of the interrupt system. The loop on error and dump pattern on error facilities used in conjunction with the pattern generator will aid in defining unique failing conditions.

The above flow can be varied by setting the control bits described in the preface to the program listing. Such functions as loop on error, halt on error, loop on manually entered pattern, dump pattern on error, loop on various patterns, and so forth, are available via the control bits. The control exercised by the control panel sense switches are indicated in the preface to the program listing, section IV.

2-5 RESTART PROCEDURE

Other than clearing the waits described in the responses to program messages, no restart of this program, as loaded, is

programmed. If a condition arises in which the operator feels a restart is necessary, the program should be reloaded. If it is absolutely necessary to restart the program without reloading, a manual transfer to the address of the label INITAUTO may be tried.

2-6 TEST DIRECTIVES

Test directives as such do not exist for this program. Optional functional controls via sense switches and control bits are described in detail in the program listing preface.

2-7 SUCCESS INDICATIONS

Successful load of this program is indicated as described on page 1 of the program listing.

The M1, ADDRESSES VERIFIED and M5, SUCCESS print-outs are indications of the passage of certain tests, as described in the program listing under message description. These messages serve mainly as milestones so that, should some unexpected hang-up occur, an indication of the point reached is available. In the event of a failure, an error message could replace either or both of the above messages.

The printout following the M6 PRI SEQ message varies according to the number of levels implemented and the priority in which they are cabled, with each change in WD group starting a new line.

The response to the M6 message is detailed in the preface to the program listing.

Note

No attempt should be made to delete the unsigned levels in WD group 0 from the sequence. If they appear in the printout, they must respond to WD instructions; therefore, to delete them from the sequence would cause false failure indications.

2-8 FAILURE INDICATIONS

To save output time, most messages from this program have been condensed to message flags (with detailed text

defining the flags in the program listing) rather than having lengthy outputs on a failure.

Certain failures generate unique flags, but 13 failing conditions are defined under the M2 error flag. This flag indicates that one or more entries have been made in the error stack and that the stack scanning routine is dumping the errors. This stacking is done in lieu of dumping failure information immediately upon detection of the failure. This is done to prevent an attempt to perform I/O operations while interrupts are active or pending.

The failure information generated by this program in the event of failure detection is intended to be used in combination, as presented, rather than as isolated particles. If, for instance, a failure output indicates that an unexpected interrupt occurred from address X'75', and an expected interrupt from address X'74' failed to occur; this, in most cases, means that the interrupt level expected to interrupt at location X'74' has picked a bit in the address it presented to the CPU. This conclusion is verified by the fact that, at some point, there is an indication that more than one interrupt occurred for a single trigger at address X'75', if the failure is solid.

Since, in the event of multiple failure indications, failures may affect the interrupt addresses presented to the CPU, the address information is considered primary. Since information such as expected sequence is extracted from the address that a level presents, if any kind of addressing failure is indicated, other failure information should be viewed critically for possible false indications. For example, in a test pattern, interrupts might be expected from addresses X'64', X'66', and X'6A'. It may be that, due to a failure, the following errors were indicated:

- a. Unexpected interrupt from X'62'
- b. X'64' and X'66' occurred before X'62'
- c. Expected interrupt from X'6A' failed to occur

In this case, the error in sequence indicated should be ignored since, as in the preceding example, other information available indicates that X'6A' has dropped a bit in its address.

SECTION III PROGRAM DESCRIPTION

3-1 GENERAL

This section contains a general description of the function of certain major routines used to accomplish the program outputs and results.

Figure 3-1 is a flow chart that indicates the program flow if the program is loaded with no control bits entered. The program flow may be altered as described in the control bit explanations.

3-2 TERMINATING FAILURES

The nature of certain failures is such that, should the failure occur, this program can no longer continue. Most of these failures involve the highest priority interrupt implemented.

The program outputs an error message and enters an endless loop, if one of the following conditions occurs:

- a. When all levels in WD group 0 are armed, enabled and triggered, while computing the highest priority level implemented, no interrupts occur. A loop is entered to arm-disable, trigger, and enable all levels in WD group 0. If any interrupts do occur, they will be ignored.
- b. An address other than X'52' or X'54' is presented as the address of the highest priority interrupt implemented. The program goes into a loop to arm-disable, trigger, and enable count pulse 1 and count pulse 3 interrupts. All interrupts are ignored.
- c. The highest priority interrupt implemented presents an address other than the address it presented when computed. The program goes into a loop to arm-disable, trigger, and enable only the highest priority interrupt implemented.
- d. If a WD instruction addressing WD group 1 generates an interrupt, the program enters a loop addressing all levels to arm-disable, trigger, and enable, specifying a WD group of one. Any interrupts that occur are ignored.

3-3 SUBROUTINES, GENERAL

The subroutines SETEXP, IGEN, and CHKPATT are used in concert to prepare for, to trigger, and to check, respectively, the patterns of interrupts used in most of the test routines.

SETEXP generates a field of data predicting the levels from which interrupts are expected to occur. This data is extracted from the input to the IGEN routine, to determine which levels will be armed-disabled, triggered, and enabled. The inhibit bit configuration under which the interrupts will occur is then used to complete the expected field.

IGEN sets the highest priority interrupt implemented into the active state via SETHI, then addresses the levels contained in its input fields by the corresponding WD instructions. The inhibit bits desired are set, the interrupt handling routine exit is set to CHKPATT, and exit is taken.

CHKPATT records the sequence in which the interrupts generated occur, checks for more than one interrupt per level, checks for unexpected interrupts as well as the absence of expected interrupts, verifies that no level occurs before a level of higher priority, and outputs any failures that occur.

Wherever possible, before interrupts are allowed to occur, as many registers as are available are loaded with XPSD instructions to prevent a hang-up due to the presentation by an interrupt level of an address between 0 and 15. If such an address is presented, an error message is printed out indicating the address presented.

The common interrupt handling routine extracts its output from the first 15 bits of the PSD stored by the common XPSD instruction at CMPINTAD and the zero or nonzero state of the register page pointer stored. This information is used to determine the address from which an interrupt occurred, as follows:

The bits corresponding to the condition code setting, the floating point masks, the decimal trap mask, and the fixed point overflow mask, stored in the PSD store location CMPAD, are compressed into a contiguous, nine-bit field. The half-word containing the stored register page pointer is then tested for a zero content. If the content is zero, the nine-bit field contains the correct address and exit is taken. If the content is not zero, a bias of 248 (X'F8') is added to the nine-bit field, and exit is taken.

The bias of 248 is determined by the fact that XPSD instructions from X'108' to X'1FF' are coded to cause the loading of a new register page pointer. The XPSD instructions from X'10' to X'107' are coded not to change the register page pointer, although addressing the same PSD locations as the XPSD instructions from X'108' to X'1FF'.

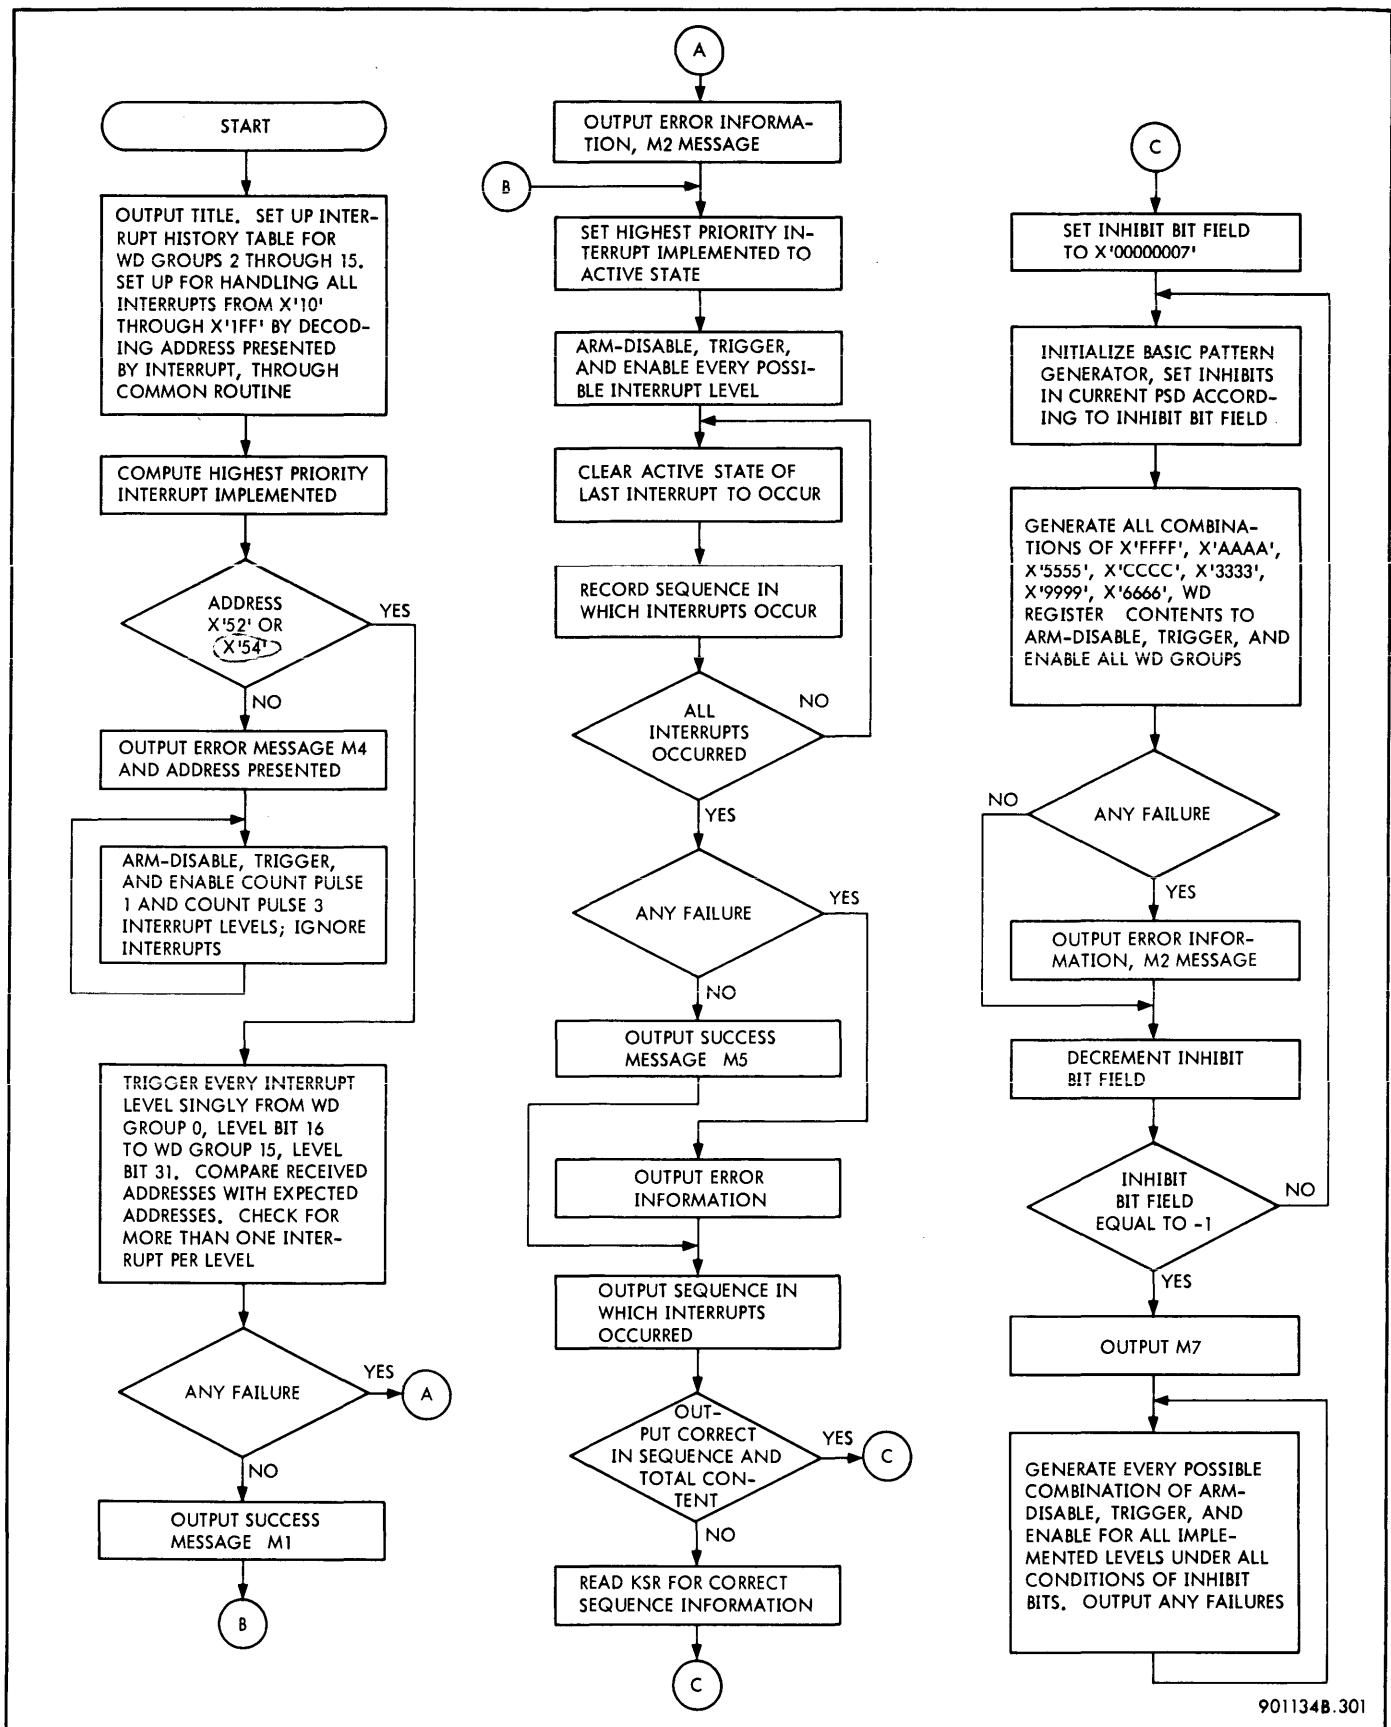

Figure 3-1. Sigma 5 and 7 Interrupt Test, Flow Chart

The subroutine SETPSDS encodes the required information and sets up the required XPSD instructions.

Any time the routine to set the highest priority interrupt, implemented into the active state (SETHI) is entered, the common interrupt handling routine exit address (ADRDCODE) is set to the address of a routine that handles any interrupt that occurs as a failure. This course is taken so that a level that can break into the active state of the highest priority level is detected as a failure. Just before the highest priority

interrupt implemented is cleared from the active state, the routine generating the interrupts inserts the desired address in the indirect exit (ADRDCODE).

Each time SETHI is entered, the address of the highest priority interrupt implemented is compared to the address that it presented when originally computed. If the address does not match or if the interrupt fails to occur, the program prints out a failure message and goes into an endless loop, addressing only the level originally computed as the highest priority implemented.

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969

3

- 75 *
- 76 * TO HANDLE INTERRUPTS GENERATED DURING THE VARIOUS TESTS PERFORMED,
- 77 * A SET OF 496 XPSD INSTRUCTIONS IS GENERATED, FROM X'10' TO X'1FF'.
- 78 *
- 79 * A SET OF 248 PROGRAM STATUS DOUBLEWORDS IS ALSO GENERATED, WITH THE
- 80 * ADDRESS OF THE XPSD INSTRUCTION ADDRESSING EACH PSD ENCODED INTO THE
- 81 * CC, FS, F2, F4, DM, AND AM BITS, AND A REGISTER PAGE POINTER OF 15.
- 82 *
- 83 * THIS SET OF INSTRUCTIONS WILL ALLOW THE HANDLING OF ALL INTERRUPTS
- 84 * GENERATED, EVEN IF INCORRECT ADDRESSES ARE PRESENTED TO THE CPU
- 85 * FROM THE INTERRUPT LOGIC. THE ONE CASE WHICH IS NOT COVERED IS
- 86 * THE CASE IN WHICH AN INTERRUPT PRESENTS AN ADDRESS BETWEEN 0 AND
- 87 * X'0F'. SINCE THE INTERRUPT LOGIC ONLY PRESENTS 3 ADDRESS LINES TO
- 88 * THE CPU, WITH THE EXCEPTION NOTED, ALL INTERRUPTS WILL OCCUR WITH-
- 89 * IN THIS FIELD OF XPSD INSTRUCTIONS, THE EXCHANGE OF PROGRAM STATUS
- 90 * DOUBLEWORDS CAUSED BY THE EXECUTION OF ANY OF THESE INSTRUCTIONS
- 91 * WILL RESULT IN THE DECODING OF THE ADDRESS OF THE LEVEL WHICH
- 92 * GENERATED THE INTERRUPT. THIS ADDRESS IS THEN CROSS-CHECKED BY
- 93 * A ROUTINE WHICH EXTRACTS THE CORRECT ADDRESS FROM THE WD GROUP
- 94 * AND LEVEL OF THE INTERRUPT. A LEVEL WHICH PRESENTS AN ADDRESS
- 95 * BETWEEN 0 AND X'F' WILL GENERATE AN ERROR MESSAGE INDICATING
- 96 * THE ADDRESS WHICH WAS PRESENTED. IF THE FAILURE IS SOLID, AND THE
- 97 * ADDRESS PRESENTED IS EITHER 5 OR 9, A HANG-UP CONDITION WILL OCCUR.
- 98 *
- 99 * IF THE ERROR MESSAGE INDICATED IS PRINTED BUT, AN INTERRUPT WHICH
- 100 * SHOULD HAVE OCCURRED WILL NOT BE RECORDED BY THE CHECKING ROUTINES.
- 101 * THIS WILL GENERATE ADDITIONAL ERROR INFORMATION WHICH SHOULD
- 102 * DIRECTLY INDICATE THE FAILING LEVEL(S).
- 103 * * * DELETED PAGE DIRECTIVE * * *
- 104 * INSTRUCTIONS REFERRING TO SENSE SWITCH CONTROL BY 'REVERSING'

205 * TRIGERS ALL LEVELS IN THE TEST GROUP SIMULTANEOUSLY, TESTS THAT
206 * ALL IMPLEMENTED LEVELS ADVANCE TO THE WAITING STATE, THEN HANDLES
207 * ALL INTERRUPTS WHICH OCCUR WITH FULL CHECKING. THE SECOND SUB-ROUTINE
208 * TRIGERS ALL IMPLEMENTED LEVELS SINGLY, CHECKS FOR THE ADVANCE TO
209 * THE WAITING STATE, THEN HANDLES THE INTERRUPT WITH FULL CHECKING.
210 *
211 * SETTING SS 2 BN WILL CAUSE LOOPING IN THE FIRST SUB-ROUTINE, AND
212 * SS 3 BN WILL ACCOMPLISH THE SAME FOR THE SECOND SUB-ROUTINE, BUT IF
213 * BOTH ARE SET BN, SS 3 BN IS NEVER TESTED. IF NEITHER IS SET BN, A LOOP
214 * FROM ONE SUB-ROUTINE TO THE OTHER IS MAINTAINED UNTIL SS 1
215 * IS REVERSED.
216 *
217 * IF A WATCH-DOG TIMER TRAP OCCURS IN THE JX-58 ROUTINE, THE ROUTINE
218 * IS ABORTED AFTER THE FOLLOWING MESSAGE IS PRINTED BUT:
219 *
220 * 'WDT, JX-58 ROUTINE ABORTED'
221 *
222 *

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969

223 * IS SPECIFIED AS THE JX-58 TEST GROUP.
224 * * * DELETED PAGE DIRECTIVE * * * *C
225 * AT CERTAIN POINTS IN THE PROGRAM, THE MESSAGE 'MN1', OR 'RESPOND,
226 * MN1' WILL BE PRINTED OUT. 'MN1' WILL CORRESPOND TO ONE OF THE
227 * FOLLOWING MESSAGES, FOR INFORMATION AND/OR RESPONSE, AND
228 * THE APPROPRIATE ACTION INDICATED SHOULD BE TAKEN. CLEARING THE
229 * WAIT, OR ENTERING THE INFORMATION REQUESTED WILL DIRECT THE PROGRAM
230 * TO THE ROUTINE TO IMPLEMENT THE DECISION. IF THE WAIT IS CLEARED
231 * BEFORE ANY ACTION HAS BEEN TAKEN, OR THE INFORMATION IS NOT ENTERED
232 * CORRECTLY, THE REQUEST CONDITION WILL OCCUR AGAIN.
233 *
234 * AT ANY POINT AT WHICH A RESPONSE VIA SENSE SWITCHES IS REQUESTED,
235 * THE SETTING OF THE SENSE SWITCHES AT THE TIME OF THE REQUEST WILL
236 * BE SEEN IN BITS 24-27 OF THE INSTRUCTION ADDRESS BEING DISPLAYED
237 * BY THE WAIT.
238 *
239 * THE FORMAT FOR ANY ADDITIONAL INFORMATION FOLLOWS EACH EXPLANATION.
240 * SEE 'IM2 ERROR' DESCRIPTION, BELOW, FOR FORMAT CONVENTIONS.
241 *
242 * M1
243 * THIS MESSAGE INDICATES THAT THE INTERRUPT LOGIC PRESENTED THE
244 * CORRECT ADDRESS FOR EVERY INTERRUPT WHICH OCCURRED IN THE INTERRUPT
245 * ADDRESS TEST.
246 *
247 * M2 (ERROR FLAG. FORMAT=T XXXXXX. T=TYPE,XXXXXX=ERROR DATA.)
248 * THE OUTPUT FOLLOWING THIS MESSAGE INDICATES AN ERROR DETECTED
249 * IN A CHECKING ROUTINE. THE ERROR TYPES, INDICATED BY THE FIRST
250 * DIGIT PRINTED, ARE AS FOLLOWS:
251 * * * DELETED PAGE DIRECTIVE * * * *C
252 * IN THE SYMBOLIC EXAMPLES FOR ERROR TYPES, THE THE FOLLOWING
253 * CONVENTIONS ARE USED:
254 * G= WD GROUP L= LEVEL BIT MINUS 16, WITHIN GROUP.
255 * BBBB= WD REGISTER BITS.
256 * C= FAILING CONDITIONS R= ROUTINE POINTER.
257 * AAA OR A = ADDRESS PRESENTED.
258 * SS= PRIORITY SEQUENCE.
259 * DIGITS SHOWN AS ZERSES WILL ALWAYS BE ZERSES FOR THE TYPE.

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969

260 *
261 * TYPE SIGNIFICANCE OF SEVEN DIGITS FOLLOWING TYPE.
262 *
263 * 1. MORE THAN ONE INTERRUPT WAS RECEIVED FOR A SINGLE TRIGGER
264 * ADDRESSING THE WD GROUP AND LEVEL INDICATED BY THE TWO LOW
265 * ORDER DIGITS.
266 *
267 * 1 00000GL
268 *
269 * 2. EXPECTED ADDRESS AND RECEIVED ADDRESS FOR A LEVEL DO NOT MATCH.
270 * THE LOW ORDER 3 DIGITS ARE THE RECEIVED ADDRESS, AND THE HIGH
271 * ORDER 3 DIGITS ARE THE EXPECTED ADDRESS.
272 *
273 * 2 AAA0AAA
274 *
275 * 3. MORE THAN ONE INTERRUPT WAS RECEIVED FOR A SINGLE TRIGGER
276 * DURING THE SEQUENCE DETERMINATION ROUTINE. THE HIGH ORDER
277 * TWO DIGITS ARE THE SEQUENCE NUMBER OF THE LEVEL, AND THE LOW
278 * ORDER TWO DIGITS ARE THE WD GROUP AND LEVEL.
279 *
280 * 3 SS000GL * * * DELETED PAGE DIRECTIVE * * * *C
281 * 4. A LEVEL OR LEVELS OCCURRED EITHER DURING THE ADDRESS CHECK
282 * ROUTINE, OR DURING THE SEQUENCE DETERMINATION ROUTINE, BUT
283 * NOT DURING BOTH ROUTINES. THE LOW ORDER FOUR DIGITS ARE THE
284 * WD REGISTER BITS, AND THE HIGH ORDER DIGIT IS THE WD GROUP.
285 * IF THE THIRD FROM THE HIGH ORDER DIGIT IS A ONE, ALL OF THE
286 * LEVELS INDICATED OCCURRED DURING THE ADDRESS TEST, WHEN LEVELS
287 * ARE TRIGGERED SINGLY, BUT NOT DURING THE SEQUENCE DETERMINATION
288 * ROUTINE, WHEN ALL LEVELS ARE TRIGGERED CONCURRENTLY. IF THE
289 * THIRD FROM THE HIGH ORDER DIGIT IS A ZERO, AT LEAST ONE OF
290 * THE LEVELS INDICATED OCCURRED DURING THE SEQUENCE DETERMINATION
291 * ROUTINE, BUT NOT DURING THE ADDRESS TEST. UNDER THE LATTER
292 * CONDITION THE ADDRESS PRESENTED MAY BE INCORRECT, AND IF IT
293 * IS, THIS WILL BECOME APPARENT BY THE ERROR INFORMATION THAT
294 * WILL BE PRINTED OUT AS THE PROGRAM CONTINUES.
295 *
296 *

 - 5. AN INTERRUPT OCCURRED BEFORE A LEVEL OF HIGHER PRIORITY. THE HIGH ORDER TWO DIGITS INDICATE THE LEVEL WHICH OCCURRED FIRST, AND THE LOW ORDER TWO DIGITS INDICATE THE LEVEL WHICH OCCURRED SECOND, OPPOSITE TO THE EXPECTED SEQUENCE OF THE TWO.
 - 6. GLOOOGGL
 - 7. AN UNEXPECTED INTERRUPT OCCURRED FOR THE GRUP AND LEVEL INDICATED BY THE TWO LOW ORDER DIGITS. THE HIGH ORDER DIGIT INDICATES THE CONDITIONS UNDER WHICH THE FAILURE OCCURRED, AS INDICATED FOR TYPE SEVEN FAILURES. IF AN INTERRUPT IS INDICATED AS A TYPE 6 FAILURE, AND THE FAILING CONDITION WAS THAT THE LEVEL WAS ARMED, ENABLED, TRIGGERED, AND NOT INHIBITED, THE LEVEL IS NOT INCLUDED IN THE FIELD OF INTERRUPTS IMPLEMENTED, IT WILL PROBABLY CAUSE A SEQUENCE ERROR INDICATION ALSO.
 - 8. C0000GL
 - * * * DELETED PAGE DIRECTIVE * * *
 - 7. AN INTERRUPT LEVEL OR LEVELS FAILED TO OCCUR WHEN EXPECTED. THE HIGH ORDER DIGIT INDICATES THE WD GROUP, AND THE LOW ORDER FOUR DIGITS ARE THE WD REGISTER BITS. THE SECOND HIGHEST ORDER DIGIT INDICATES THE CONDITIONS UNDER WHICH THE LEVEL CORRESPONDING TO THE HIGHEST ORDER REGISTER BIT FAILED, AS FOLLOWS:
 - AR=ARMED, EN=ENABLED, TR=TRIGGERED, IN=INHIBITED. N PREFIX=NOT.
 - 0. NAR,NEN,NTR,NIN.
 - 1. NAR,NEN,NTR,IN.
 - 2. NAR,NEN,TR,NIN.
 - 3. NAR,NEN,TR,IN.
 - 4. NAR,EN,NTR,NIN.

 - A. AR,NEN,TR,NIN.
 - B. AR,NEN,TR,IN.
 - C. AR,EN,NTR,NIN.
 - D. AR,EN,NTR,IN.
 - E. AR,EN,TR,NIN.

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969

- 334 * 70 NARSEN,TR,IN. F. ARSEN,TR,IN.
335 *
336 * 7 GCD0BBBB
337 *
338 * 8. AN INTERRUPT PRESENTED AN ADDRESS OUTSIDE THE RANGE X'50'-X'13F'.
339 * THE THREE LOW ORDER DIGITS ARE THE ADDRESS PRESENTED.
340 *
341 * 8 0000AAA * * * DELETED PAGE DIRECTIVE * * *
342 *
343 * 9. AN INTERRUPT PRESENTED AN ADDRESS BETWEEN 0 AND 15. THE
344 * LOW ORDER DIGIT IS THE ADDRESS PRESENTED.
345 *
346 * 9 000000A
347 *
348 * A. ALL IMPLEMENTED LEVELS IN WD GROUP UNDER TEST DID NOT ADVANCE
349 * TO THE WAITING STATE WHEN TRIGGERED VIA THE JX-58. THE FOUR
350 * LOW ORDER DIGITS ARE THE LEVEL BITS WHICH FAILED.
351 *
352 * A 000BBBBB
353 *
354 * B. IN THE SECOND SUB-Routine OF THE JX-58 TEST ROUTINE, A LEVEL
355 * WHICH HAS INTERRUPTED AT SOME PREVIOUS TIME FAILED TO ADVANCE
356 * TO THE WAITING STATE WHEN TRIGGERED VIA THE JX-58.
357 * THE SINGLE BIT INDICATED WITHIN THE FOUR LOW ORDER DIGITS
358 * IS THE WD REGISTER BIT FOR THE FAILING LEVEL. IF THE LEVEL
359 * INDICATED ONLY FAILS VIA THE JX-58, THE FAILURE IS PROBABLY
360 * THE NORMAL TRIGGERING DIODE.
361 *
362 * B 000BBBBB
363 *
364 * C. AN INTERRUPT LEVEL PRESENTED AN ADDRESS OUTSIDE THE RANGE X'50'
365 * X'13F' DURING THE SEQUENCE DETERMINATION ROUTINE. THE HIGH ORDER
366 * TWO DIGITS ARE THE SEQUENCE NUMBER, AND THE LOW ORDER THREE
367 * DIGITS ARE THE ADDRESS PRESENTED.
368 *

370 *

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969 11

- 371 * D. AN INTERRUPT OCCURRED WHILE THE HIGHEST PRIORITY INTERRUPT WAS
372 IN THE ACTIVE STATE. THE THREE LOW ORDER DIGITS ARE THE ADDRESS
373 PRESENTED.
- 374 *
- 375 D 0000AAA
- 376 *
- 377 *
- 378 M3 WHEN ALL LEVELS IN WD GROUP ZERO WERE ADDRESSED BY WD INSTRUCTIONS
379 TO ARM=DISABLE, TRIGGER, ENABLE, NO INTERRUPTS OCCURRED. THE PROGRAM
380 HAS GONE INTO A LOOP ARMING, ENABLING, AND TRIGGERING ALL WD GROUP
381 ZERO LEVELS. IF ANY INTERRUPTS DO OCCUR, THEY WILL BE IGNORED.
- 382 *
- 383 *
- 384 M4 AN ADDRESS OTHER THAN X'52' OR X'54' WAS PRESENTED AS THE LOCATION
385 OF THE HIGHEST PRIORITY INTERRUPT IMPLEMENTED. THE ADDRESS PRESENTED
386 FOLLOWS THIS MESSAGE. THE PROGRAM GOES INTO A LOOP ADDRESSING ONLY
387 COUNTER PULSE ONE AND COUNTER PULSE THREE INTERRUPTS.
- 388 *
- 389 AAA
- 390 *
- 391 M5 ALL INTERRUPTS WHICH OCCURRED DURING SEQUENCE DETERMINATION ROUTINE
392 PRESENTED CORRECT ADDRESSES; NO MULTIPLE INTERRUPTS OCCURRED FOR
393 ANY SINGLE TRIGGER, AND ALL LEVELS WHICH OCCURRED IN THE ADDRESS
394 CHECK ROUTINE OCCURRED IN THIS ROUTINE. SEQUENCE FOLLOWS.
395 * * * DELETED PAGE DIRECTIVE * * * *C
- 396 *
- 397 M6 THE PRINT-OUT FOLLOWING THIS MESSAGE IS THE PRIORITY SEQUENCE
398 OF ALL INTERRUPTS WHICH WERE GENERATED BY WD INSTRUCTIONS. THE
399 FIRST DIGIT OF EACH PAIR OF DIGITS IS THE WD GROUP, AND THE
400 SECOND DIGIT IS THE WD REGISTER BIT NUMBER MINUS SIXTEEN, THUS:
401 *
- 402 03 WOULD REFER TO COUNTER FOUR COUNT PULSE INTERRUPT, AND
403 26 WOULD REFER TO THE SEVENTH INTERRUPT LEVEL IN EXTERNAL
404 CHASSIS 2. ALL DIGITS ARE HEXADECIMAL.
- 405 *
- 406 *
- 407 THE LIST SHOULD BE CHECKED FOR ACCURACY IN SEQUENCE, AND IN TOTAL

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969 12

- 408 * CONTENT: IF CORRECT IN ALL RESPECTS, SENSE SWITCH 2 SHOULD BE
409 REVERSED AND THE WAIT CLEARED.
- 410 *
- 411 * IF AN ERROR EXISTS, SENSE SWITCH 3 SHOULD BE REVERSED. IF SENSE
412 SWITCH 3 IS REVERSED, THE KSR WILL BE ADDRESSED FOR INPUT. THE
413 CORRECT SEQUENCE SHOULD BE ENTERED, IN THE FORMAT OF THE OUTPUT,
414 EXCEPT THAT CONSECUTIVE LEVELS MAY BE INDICATED WITH A DASH, THUS:
415 *
- 416 * 02-05 NEW LINE CHARACTER
- 417 * 20-3F NEW LINE CHARACTER
- 418 * 06-0A NEW LINE CHARACTER
- 419 * 40-6B NEW LINE CHARACTER
- 420 */END NEW LINE CHARACTER
- 421 *
- 422 * THE '/END' INPUT INDICATES THAT ALL ENTRIES HAVE BEEN COMPLETED.
- 423 *
- 424 * SINGLE LEVELS MAY BE ENTERED AS FOLLOWS:
425 * 02 NEW LINE CHARACTER
- 426 * 03 NEW LINE CHARACTER
- 427 */END NEW LINE CHARACTER
- 428 *
- 429 * IF AN ERROR IS MADE IN THE INPUT, ENTER '/SEQ', AND RE-ENTER
430 THE ENTIRE SEQUENCE.
- 431 * * * DELETED PAGE DIRECTIVE * * * *C
- 432 * IF AN UN-NOTICED ERROR IS MADE IN THE INPUT, THE MESSAGE
433 'INV! WILL BE PRINTED, AND THE KSR RE-ADDRESSED FOR INPUT.
- 434 * RE-ENTER ONLY THE LAST ENTRY. THE SEQUENCE MUST NOT BE RE-STARTED.
- 435 *
- 436 * IF THE SEQUENCE INDICATES THAT INTERRUPTS HAVE OCCURRED FROM THE
437 UNASSIGNED LEVELS IN WD GROUP ZERO, THEY SHOULD NOT BE CONSIDERED
438 ERRORS. NOR SHOULD ANY ATTEMPT BE MADE TO DELETE THEM FROM THE
439 PRIORITY SEQUENCE. SUCH AN ATTEMPT WOULD CAUSE A FALSE INDICATION
440 OF UNEXPECTED INTERRUPTS FROM THOSE LEVELS ANY TIME THEY ARE ARMED,
441 ENABLED, TRIGGERED, AND NOT INHIBITED.
- 442 *
- 443 *
- 444 M7 THE BASIC TESTS OF THE INTERRUPT SYSTEM HAVE BEEN COMPLETED. SINCE

663	*	INTERRUPTS. NO LEVELS IN WD GROUP FOUR THROUGH FIFTEEN WILL BE
664	*	ARMED AND DISABLED, NO LEVELS IN WD GROUP THREE THROUGH FIFTEEN
665	*	WILL BE ENABLED, AND NO LEVELS IN WD GROUP TWO THROUGH FIFTEEN
666	*	WILL BE TRIGGERED.

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969 19

667 * IF ANY ERRORS ARE MADE IN THE INPUT, THE MESSAGE
668 * 'INV' WILL BE PRINTED. RE-ENTER ONLY THE LAST WD GROUP.
669 * TO RE-START THE ENTIRE ENTRY, ENTER /PAT NEW LINE CHARACTER.
670 * * * DELETED PAGE DIRECTIVE * * *
671 * THE FOLLOWING PROCEDURE MAY BE USED TO TEST THE 7700 INTERPROCESSOR *C
672 * INTERRUPT FEATURE. (CPU-T9-CPU INTERRUPT)
673 *
674 * IF CPU'S INVOLVED SHARE MEMORY LOCATIONS, BE CERTAIN THAT THERE
675 * IS NO OVERLAP OF ADDRESSES WITHIN THE FIRST 8K WORDS OF CORE
676 * BETWEEN THE PROCESSORS.
677 *
678 * LOAD THE PROGRAM ON BOTH PROCESSORS. WHEN THE BASIC TESTS HAVE
679 * BEEN COMPLETED, SET CONTROL BIT 9 ON EACH PROCESSOR, TO SELECT
680 * THE MANUAL ENTRY ROUTINE. MAKE THE FOLLOWING ENTRIES ON BOTH
681 * PROCESSORS.
682 *
683 * ARM AND DISABLE ALL LEVELS.
684 *
685 * ENABLE ALL LEVELS EXCEPT IN WD GROUP IN WHICH INTERPROCESSOR
686 * INTERRUPTS APPEAR. IN THIS GROUP, ENABLE THE 000 LEVELS WHICH
687 * ARE INTERCONNECTED AND ALL OTHERS NOT INTERCONNECTED.
688 *
689 * TRIGGER ONLY THE EVEN LEVELS IN THE WD GROUP IN WHICH THE
690 * INTERPROCESSOR INTERRUPTS APPEAR.
691 * * * DELETED PAGE DIRECTIVE * * * *C
692 * SET INVHIBITS TO ZEROS.
693 *
694 * WHEN ALL THE ABOVE INFORMATION HAS BEEN ENTERED ON BOTH PROCESSORS,
695 * EACH PROCESSOR WILL ACTUALLY BE TRIGGERING INTERRUPTS IN THE OTHER.
696 * BY OBSERVING THE INPUT, IT CAN BE SEEN THAT NO INTERRUPTS SHOULD
697 * BE EXPECTED IN EITHER PROCESSOR, CONSIDERING THE FACT THAT THE
698 * PREDICTING ROUTINE ONLY USES ITS OWN INPUT TO DETERMINE WHICH
699 * INTERRUPTS SHOULD OCCUR. ONCE A SYNCHRONISM BETWEEN THE PROCESSORS
700 * HAS BEEN ACHIEVED, THEY WILL BEGIN TO RECEIVE INTERRUPTS FROM EACH
701 * OTHER. THIS WILL GENERATE ERROR INFORMATION. THE ERROR INFORMATION
702 * SHOULD INDICATE UNEXPECTED INTERRUPTS FROM ALL INTERPROCESSOR LEVELS.
703 *

SIGMA 5/7 INTERRUPT TEST 704143-51C00 FEBRUARY 20, 1969 20

704 * SYNCHRONISM IS ACHIEVED BY ADDRESS STAPPING BOTH PROCESSORS AT THE
705 * ADDRESS OF 'CHKPATT' + 3 (X'632'). BY ALTERNATELY CLEARING THE WAIT
706 * CONDITION ON EACH PROCESSOR BY MOVING THE COMPUTER SWITCH FROM RUN
707 * TO IDLE T9 RUN, ERROR PRINTOUTS SHOULD OCCUR FOR EVERY INTERPROCESSOR
708 * LEVEL, AND NO OTHER LEVELS.
709 *
710 * AN EXAMPLE OF THE INPUTS AND CORRECT OUTPUTS FOR THE SPECIFIED COND-
711 *ITIONS FOLLOWS.
712 * * * DELETED PAGE DIRECTIVE * * * *C
713 * CONDITIONS:
714 * 2 SIGMA 7 PROCESSORS.
715 * NO SHARED MEMORY.
716 * FIRST EXTERNAL CHASSIS (WD GROUP 2) ON PROCESSOR 'A' IS
717 * CONNECTED TO SECOND EXTERNAL CHASSIS (WD GROUP 3) ON
718 * PROCESSOR 'B' VIA A 7200, WITH 3 LEVELS CONNECTED IN
719 * EACH DIRECTION. LEVELS 6-11 ON PROCESSOR 'A' ARE
720 * CONNECTED TO LEVELS 0-5 ON PROCESSOR 'B'.
721 * PROCESSOR 'A' HAS THE FOLLOWING ADDITIONAL LEVELS IMPLEMENTED.
722 * 00 01 02 03 04 06 07 08 09 0A 0B
723 * 20 21 22 23 24 25
724 * 30 31
725 * 40 41 42 43
726 * PROCESSOR 'B' HAS THE FOLLOWING ADDITIONAL LEVELS IMPLEMENTED.
727 * 02 03 04 05 08 09 0A 0B
728 * 20 21 22 23
729 * 35 37
730 * 40 41
731 *
732 *
733 * THE FOLLOWING INPUT IS MADE:
734 * * * DELETED PAGE DIRECTIVE * * * *C
735 * ON PROCESSOR 'A'
736 *
737 * F3FO
738 * FFF0
739 * C
740 * F

TEST FOR PREVIOUS INT
 OR IF NO PREVIOUS INT FRM LEVEL.
 FLAG ERROR TYPE.
 MAKE ENTRY TO TABLE OF IMPLEMENTED
 INTERRUPT LEVELS.
 CLEAR INTERRUPT FROM ACTIVE STATE,
 AND CONTINUE TRIGGERING.
 COMBINE REC AND EXPECTED INT.
 PUT HIGHEST PRI INT IN ACTIVE STATE.
