

SYSTEMS ENGINEERING LABORATORIES PROGRAM LIBRARY

SOFTWARE DESCRIPTION

CATALOG NO. 300001F

DATE 1 April 1971

PROGRAM TITLE: SYSTEMS 810A/B STANDARD LOAD/ DUMP PACKAGE

PURPOSE: To provide capability for:

- (1) Loading relocatable object programs generated by the SYSTEMS 810A/B Macro-Assembler or SYSTEMS 810A/B FORTRAN IV Compiler;
- (2) Dumping selected areas of memory in absolute binary format;
- (3) Loading object modules generated by the absolute dump function,

CONFIGURATION: SYSTEMS 810A/B with ASR-33, High Speed Paper Tape Reader/Punch, and 7-track or 9-track Magnetic Tape/BTC 1.

SOFTWARE: Stand-Alone

PROGRAM LANGUAGE: SYSTEMS 810A/B Assembler Language

SIZE: 2000₈

LOADING PROCEDURE:

Use of this package assumes a memory configuration of greater than 4K; otherwise, the SYSTEMS STANDARD BOOTSTRAP PACKAGE (Catalog No. 300000F) will provide similar Load/Dump capabilities.

The procedure required to load this package includes:

- (1) MASTER CLEAR the computer;
- (2) Load the SYSTEMS 810A/B STANDARD BOOTSTRAP PACKAGE (Catalog No. 300000) as specified in the program description;
- (3) Position the SYSTEMS 810A/B STANDARD LOAD/DUMP PACKAGE (Catalog No. 300001) in the desired input device;
- (4) If the input device is ASR-33 reader control switch 0 (zero) should be reset; if the input device is High Speed Paper Tape Reader, control switch 0 (zero) should be set;
- (5) Enter 006007_8 into the P-Counter ($006006_8 / 810B$);
- (6) Enter the relocation base for the STANDARD LOAD/DUMP PACKAGE into the A-Accumulator; this is the load address for the package;
- (7) Depress START twice - the STANDARD LOAD/DUMP PACKAGE will be loaded as specified;
- (8) The following will be printed on the ASR-33 teletypewriter:

```
LC
EJ
XXXXX      00001
```

Indicating loading complete, end-of-job code processed, the memory high load address, and the next available map zero location.

USE:

The SYSTEMS 810A/B STANDARD LOAD/DUMP PACKAGE may be used to load object programs in relocatable binary format; to dump selected areas of memory in absolute binary format; and to load object modules in absolute binary format.

I - RELOCATABLE LOADER

The procedure required to use the relocatable loader portion of the STANDARD LOAD/DUMP PACKAGE includes:

(1) Position the relocatable binary object program to be loaded in the desired input device;

(2) Make the following manual entries:

- A-Accumulator = Relocation Base for program
- B-Accumulator = Map Zero Starting Location
- P-Counter = Relocatable Loader Starting Location
(000007₈ + Loader Relocation Base/810A)
(000006₈ + Loader Relocation Base/810B)

(3) Set the appropriate control switches as follows:

- Control Switch 0 Set = Input from High Speed Paper Tape Reader
- Control Switch 0 Reset = Input from ASR-33 Reader
- Control Switch 1 Set = List all subroutines referenced by program
- Control Switch 2 Set = List all unloaded subroutines referenced by program
- Control Switch 3 Set = Input from magnetic tape
- Control Switch 4 Set = List all intermap references
- Control Switch 5 Set = Inset map bit on map zero references
- Control Switch 6 Set = 9-Track Magnetic Tape Input (If Switch 3 is set)
- Control Switch 6 Reset = 7-Track Magnetic Tape Input (If Switch 3 is set)
- Control Switch 7 Set = Binary Magnetic Tape Input (created under an 810B RTX System - If Switch 3 is set)
- Control Switch 10-15 = Used to specify which logical unit number designates magnetic tape. An entry must be made if magnetic tape input is desired. Example: Switches 13-15 would be set to designate logical Unit 7.

NOTE

For input from 7 or 9 track magnetic tape, the loader assumes BTC1. Thus, programs loaded from magnetic tape must not alter the contents of locations 1060₈ & 1061₈ (It is suggested that they be loaded above 1061.). If a different BTC is desired, the FWA BTC memory location may be manually loaded into relocation base + 1415₈ in the Load/Dump Program.

NOTE

In loading SYSTEMS 810A/B FORTRAN IV Compiler generated object programs, the map zero starting location (B-Accumulator) must be greater than 10₈ if any library subroutines have been called by the source program.

- (4) Depress START twice - the program will be loaded;
- (5) If "EJ" only is printed on the ASR-33 teletypewriter, the relocatable loader is awaiting further input to satisfy external subroutines referenced by the loaded program. In this instance, position the unloaded external program(s) in the proper input device and depress START once;

NOTE

Do not MASTER CLEAR the computer prior to loading external subroutines.

- (6) When loading is complete, the following will be printed on the ASR-33 teletypewriter:

LC
EJ
XXXXX YYYYY, where

XXXXX - indicates the highest memory location used by the program;
YYYYY - indicated the next available map zero location

- (7) To execute the loaded program:
- (a) MASTER CLEAR the computer;
 - (b) Enter the starting location of the program into the P-Counter;
 - (c) Depress START twice to begin program execution.

II - ABSOLUTE DUMP

The procedure required to use the Absolute Dump portion of the STANDARD LOAD/DUMP PACKAGE includes:

(1) Set the appropriate control switches as follows:

- Control Switch 0 Set = Dump to High Speed Paper Tape Punch
- Control Switch 0 Reset = Dump to ASR-33 Paper Tape Punch
- Control Switch 1 Set = Dump Intermap References after dumping program

(2) Make the following manual entries:

| <u>Location</u> | <u>Entry</u> |
|--|-----------------------|
| <i>001776</i> → 001776 ₈ + Loader Relocation Base | End of Dump Address |
| <i>001777</i> → 001777 ₈ + Loader Relocation Base | Start of Dump Address |

(3) Enter ^{*001561*} 001561₈ + Loader Relocation Base ^{*06*} (810A) or (001560₈ + Loader Relocation Base/810B) into the P-Counter. This is the start address for the Absolute Dump portion of the STANDARD LOAD/DUMP PACKAGE;

(4) Depress START once - a dump of the specified memory locations will be generated in absolute binary format acceptable to the Absolute Loader portion of this package (below).

III - ABSOLUTE LOADER

The procedure required to use the Absolute Loader portion of the STANDARD LOAD/DUMP PACKAGE includes:

- (1) Position the absolute binary object module to be loaded in the the desired input device;
- (2) Set the appropriate control switches as follows:
 - Control Switch 0 Set = Input from High Speed Paper Tape Reader
 - Control Switch 0 Reset= Input from ASR-33 Reader
 - Control Switch 1 Set = Load intermap references after loading program
- (3) Enter $(001673_8 + \text{Loader Relocation Base}/810A)$ or $(001672_8 + \text{Loader Relocation Base}/810B)$ into the P-Counter. This is the start address for the Absolute Loader portion of the STANDARD LOAD/DUMP PACKAGE;
- (4) Depress START twice - the core-image contents of the absolute binary input module will be loaded into the same portion of memory from which originally dumped.

METHOD:

(1) RELOCATABLE LOADER

- (a) Tape format consists of blocks of 111 frames. Each block contains a start code, thirty-six 24-bit words, and a 16-bit check sum. A complete block is read by the loader before the first word in the block is processed;
- (b) If loader input is from magnetic tape, tape is read from Tape Transport Number 2/Binary Format (556 BPI, 3 characters/word for 7-track, and 800 BPI, 2 characters/word for 9-track).
- (c) If a parity error occurs during input, five attempts are made to read the record before the loader message "R" is printed on the ASR-33 teletypewriter, and the Computer HALTS. Clearing the HALT will cause the record to be accepted.
- (d) The following messages are output by the relocatable loader:
 - CK - Check sum Error
 - MO - Memory Overflow into Area of Core Used by Loader
 - CM - Common Request prior to Common Definition
 - LC - Loading Process Complete
 - EJ - End of Job

(2) ABSOLUTE DUMP

Tape format consists of a start code, a 16-bit starting address, and a 16-bit negative word count followed by blocks of 66 frames each. The last block may have less than 66 frames. Each block is terminated with a 16-bit check sum.

(3) ABSOLUTE LOADER

- (a) Tape format consists of a start code, a 16-bit starting address, and a 16-bit negative word count followed by blocks of 66 frames each. The last block may have less than 66 frames. Each block is terminated with a 16-bit check sum. Words are stored into core as they are read.
- (b) If a check sum error is encountered during the loading process, the loader message "K" will be printed on the ASR-33 teletypewriter, and the computer will HALT. Clearing the HALT will cause the record to be accepted.
