SECTION I

INTRODUCTION AND INSTALLATION

1.1 INTRODUCTION

The 16 Input/16 Output Data Module shown in figure 1-1 provides two-way communications between the Texas Instruments Model 960 Computer Family and devices or transducers that are operated by or generate digital control signals.

The module provides 16 input lines and 16 output lines. Each line can be addressed as a single independent binary value or as a member of a group of 2 to 16 lines. Alternate versions of the Data Module provide 15 normal inputs, 14 normal outputs, an interrupt input line, and an interrupt mask output.

Variations of the 16 Input/16 Output Data Module are listed in table 1-1.

Table 1-1. 16 Input/16 Output Data Module Configurations

Part Number	Description
214103-0001	16 Inputs/16 outputs. Open collector outputs. No Interrupt. Nominal input current 15ma with low level input.
214103-0002	15 inputs/14 outputs, interrupt and interrupt mask. Interrupts generated by trailing edge of IN15- pulse. Nominal input current is 15ma with low level input. The output lines are internally pulled up to approximately 5Vdc logic power with 5.1 K ohm resistors.
214103-0003	15 inputs/14 outputs, interrupt, and interrupt mask. Interrupt is generated by leading edge of IN15- pulse. Nominal input current is 15ma with low level input. The output lines are internally pulled up to approximately 5Vdc logic power with 5.1 K ohm resistors.
214103-0004	16 inputs/16 outputs, no interrupt. Nominal input current is 1.5ma with low level input. Open collector outputs. +5Vdc available at top edge connector, P2-1 and A; through 30AWG wire fuse.
214103-0005	15 inputs/14 outputs, interrupt, and interrupt mask. OUT8-flip-flop is cleared by CRUMR-. Nominal input level is 15ma with low level input. The output lines are internally pulled up to approximately 5Vdc logic power with 5.1 K ohm resistors.
214103-0006	15 inputs/14 outputs, interrupt and interrupt mask. Interrupt is generated by leading edge of IN15- signal. Nominal input current is 15ma with low level input. The output lines are internally pulled up to approximately 5Vdc logic power with 5.1 K ohm resistors. OUT15- is connected to input 15 on input multiplexer Z3 making it independent of the interrupt mask.

1.2 INSTALLATION

The 16 Input/16 Output Data Module can be installed in any standard CRU port (port numbers EF0 through EF3), optional internal expansion ports (EF4 through EFF), or external expansion chassis ports (00 through F0). When inserted into an internal CRU port, the component side of the printed-circuit board faces the front of the computer. In an external expansion chassis, the component side of the module faces the Buffer Module as shown in figure 1-2.

External inputs and outputs are located on the top edge 72-pin connector. If other than the standard cables are used, connections to the module can be made by using connector and cover assembly, part number 217081-0001 (3/8-inch diameter cable maximum) or part number 217081-0002 (1/2-inch diameter maximum). Signal line length between the module and user's equipment should be kept as short as possible. The use of twisted pair or coaxial cable is recommended. Pin designators are listed in table 4-1.

1.2.1 DATA MODULE FILTERS AND PULLUP VOLTAGES. Capacitor mounting pads are provided across each input signal pair to allow the user to decouple noisy input signals. Typical capacitor values for purpose are 0.01 to 0.5 microfarad. The pad spacing is 0.25 inch (center-to-center) and the capacitor height is limited by a component height restriction of 0.31 inch. If necessary capacitor leads can be bent to meet height restrictions. The introduction of noise into the system power supply should be avoided. Excessively noisy signals should be buffered prior to input to the module.

When an application dictates the use of external voltage on the TTL Data Module output circuits, it must not exceed 30 volts or 50 milliamps.

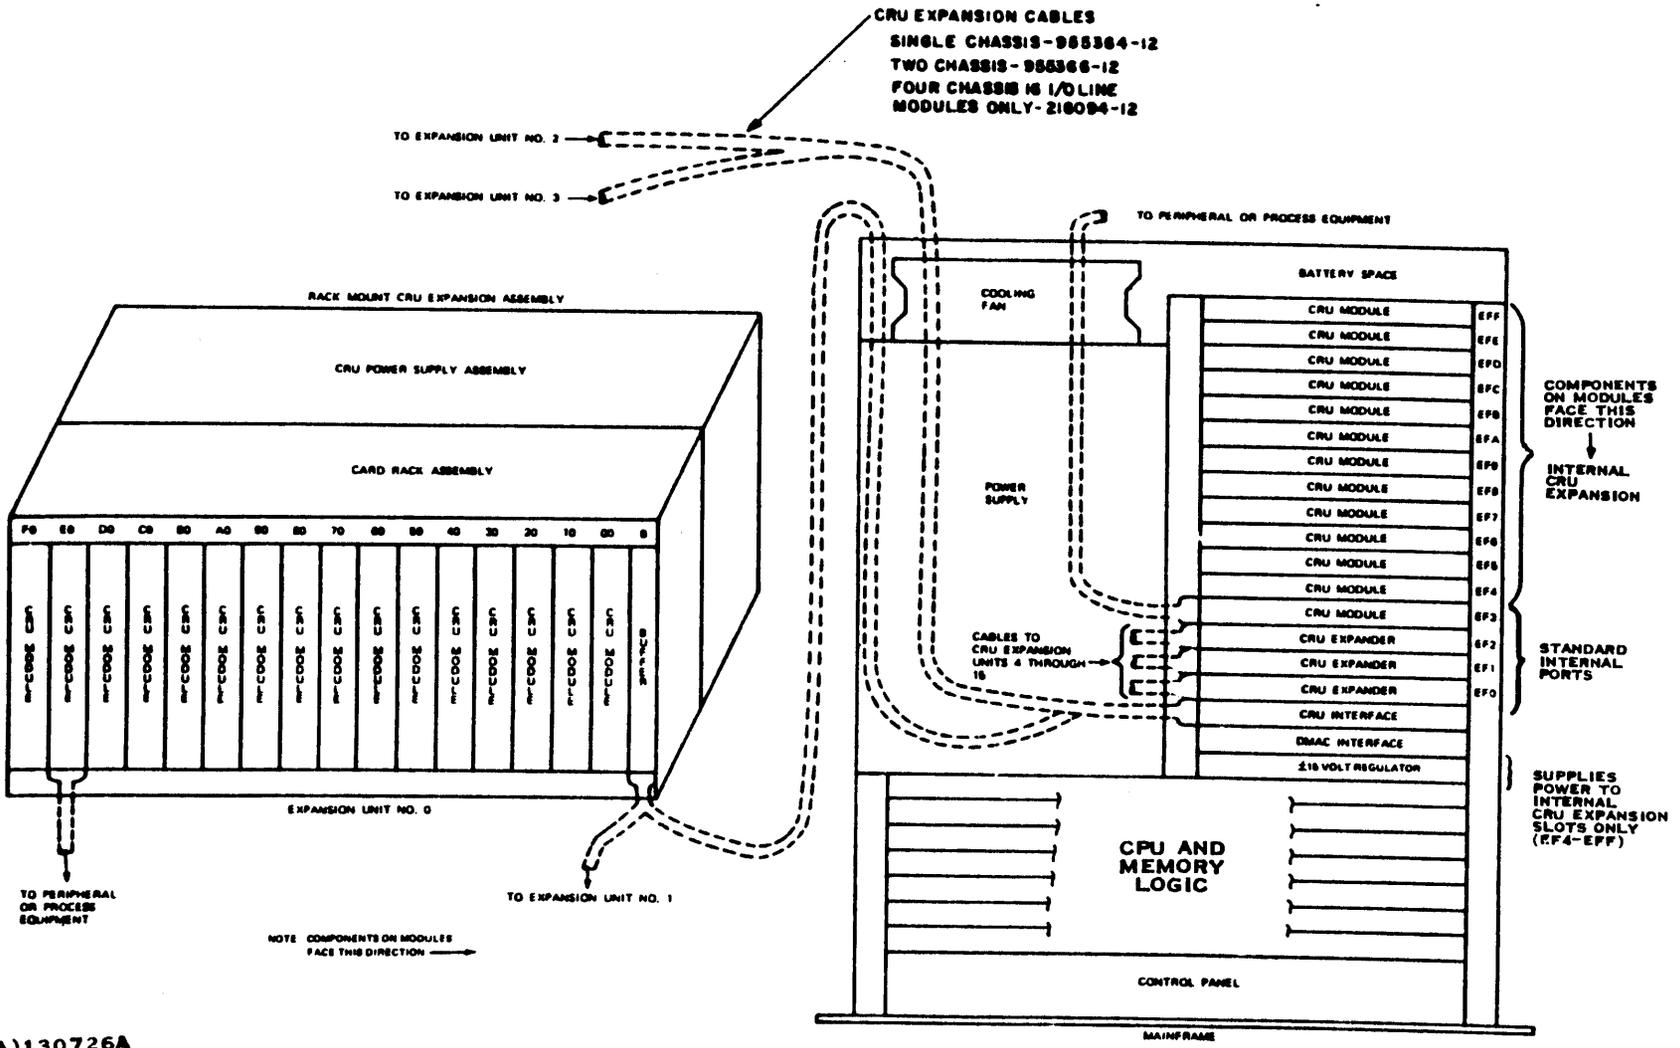

1.2.2 OPTION SELECTION. If the interrupt option is selected, jumper options provide for the interrupt to be set by either a logic zero or a logic one on either the positive or the negative transition.

Jumper selectable options (summarized in table 1-2):

- Input bit 15 = Input bit 15, output bit 15 or CRU INT. CRU INT = Logic AND of interrupt (OUT15LATCH) and mask (OUT14).
- OUT14 to top-edge connector (yes or no).
- OUT15 to top-edge connector (yes or no).
- Interrupts - select one
 - 1) no interrupts
 - 2) negative-edge triggered interrupt
 - 3) positive-edge triggered interrupt
- Supply 5 volts to top-edge connector (yes or no).
- State of OUT8 after power on reset (set or clear).

SECTION II

OPERATING INSTRUCTIONS

Operation of a data module consists entirely of the programming required to perform some pre-established function. This module is commonly used to complete the interface to paper-tape readers, paper-tape punches, line printers, analog systems, plotters, CRT displays, digital voltmeters, and other devices that require parallel data transfer or control. The Texas Instruments Model 960 Computer User's Manuals that support the related peripheral hardware contain operating instructions for the individual peripheral devices. These manuals also include the programming details of the individual interfaces.

As an example, consider a very simple paper-tape reader with an interface specification as defined in table 2-1. The paper-tape reader uses a stepping motor that must be pulsed once for each character read. When the sprocket signal goes from ZERO to ONE, the character is available to be read.

A simple routine to read 80 characters from tape, storing these characters one per word in memory, might appear as listed in table 2-2. Note that the STCR instruction in table 2-2 is constructed to input 9 bits. The most significant bit of that field is the Ready bit which is normally a ZERO. Hence the high order eight bits placed in memory will be ZERO's when an eight bit field is inputted with the reader ready. This is normally desirable.

Table 2-1. Example of Paper Tape Reader Bit Assignments

Bit Addresses	Function*
CRU Input:	
0	} Character Read— Bit 0 is LSB 1/0 = hole/no hole
1	
2	
3	
4	
5	
6	
7	
8	Reader Ready— 0/1 = ready/not ready
.	
.	
.	
13	Sprocket— 1/0 = hole/no hole
14	Not used
15	Interrupt— 1 = interrupt — occurs when sprocket goes from 0 to 1 (5 Volts to 0 Volts)
CRU Output:	
0	Step— 1 = step — normally = 0 and set = 1 for 10 μ sec to step. tape moves one character for each step signal.
.	
.	
14	Interrupt Mask— 1/0 = enable/disable interrupts
15	Clear Interrupt 1/0 = set/clear

*ONE's and ZERO's are values as contained in memory.

PROGRAM				PROGRAMMED BY						CHANGE				PAGE		OF			

In situations where idling the computer while waiting for characters is undesirable, the input routine must be run with interrupt control. This condition allows other work to be performed between appearances of the sprocket signal. The following is not a complete description of how such routines should be written, but is given as an illustration of an interrupt driven input routine.

Memory location 94_{16} must contain the instruction SSB CRUINT (or possibly SXBS CRUINT) where CRUINT is as defined in the program listed in table 2-3. This routine leaves many dangling ends including: the problems of register saving and restoring, the packing of characters 2 per word, and the contents of NOTME and FINISH. In most instances, the monitors or operating systems that are available from Texas Instruments are written to service all devices that generate CRU interrupt. Thus, this problem is eliminated for the user.

SECTION III
PERIPHERAL SPECIFICATIONS

(Not Applicable)

SECTION IV

INTERFACE AND CONTROL SPECIFICATIONS

4.1 GENERAL

This section discusses the computer and 16 Input/16 Output Data Module interfaces, the signatures, and pin assignments for these signals, and the functioning of the signal generation circuitry. It also describes control of data transfer and presents the formats of software instructions used for CRU bit and field manipulation. The electrical and physical characteristics of the data module are specified. The jumper and resistor schedules for the various options are shown in the logic diagram (TI Drawing Number 214104) in Section VI.

4.2 CPU INTERFACE

The following paragraphs discuss the interface between the 16 Input/16 Output Data Module and the CPU. They include discussions of connector pin assignments, addressing of individual modules, control signals and data transfer, and CRU input and output instruction formats.

4.2.1 CONNECTOR PIN ASSIGNMENTS. The data module interfaces with the CPU through the Communications Register Unit (CRU). This interface is completed through the bottom-edge 80-pin connector of the module. Table 4-1 lists the interface signal signatures, pin numbers, and descriptions of signals. The logic voltage levels of these signals are TTL-compatible. Signals that

Table 4-1. CPU Interface Signals

Signature	Pin Number	Description
GROUND	1, 2, 79, 80	System Ground
CPUDATA OUT	16	Serial Data From CPU to Module
STORECLOCK-	22	CPU Output Data Strobe
CRUBIT15	34	CRU bit address select line

CRUMR-	76	Power up reset
VCC	77, 78	Power, +5 Vdc
CRUINT-	66	Interrupt to CRU

Note pins 66 and 76 are inputs to CRU all others are outputs.

are true when the voltage level is low (zero) have signatures that end with a hyphen (-). An example of such a signal signature is CRUSEL0-. The pin assignment of the TTL Data Module connector are specified in table 4-2 and shown in figure 4-1. This table includes the 16 inputs, 16 outputs, and their ground returns. All grounds are common and are connected to the CPU digital ground bus. Connection to the module is normally made with a 72-pin connector (TI Part Number 217081-0001 or 217081-0002).

4.2.2 MODULE AND LINE ADDRESSING. Module selection is accomplished in the CRU interface or Expansion Module by decoding the CRU address rack and module fields (bits 4 through 11) of the CRU base address register. The CRU base address register contains the effective CRU base address. The effective CRU address is calculated by adding the register file CRU base address (supervisor mode location 87_{16} or worker mode location $8F_{16}$) and the CRU address field of the instruction being executed. The fields of this address are:

(A)132026

Figure 4-1. Module Connector Pin Arrangement

Within the specified chassis the module select field is decoded to one of sixteen slots. The slot receiving the resulting signal, CRUSELO-, is enabled. The 16 Input/16 Output Data Modules input multiplexer, Z3, and output decoder, Z13, are selected by CRUSELO- (see figure 4-2). The CRU line address field (bits 12 through 15) determines the specific line or bit to be input or output (see figure 4-3).

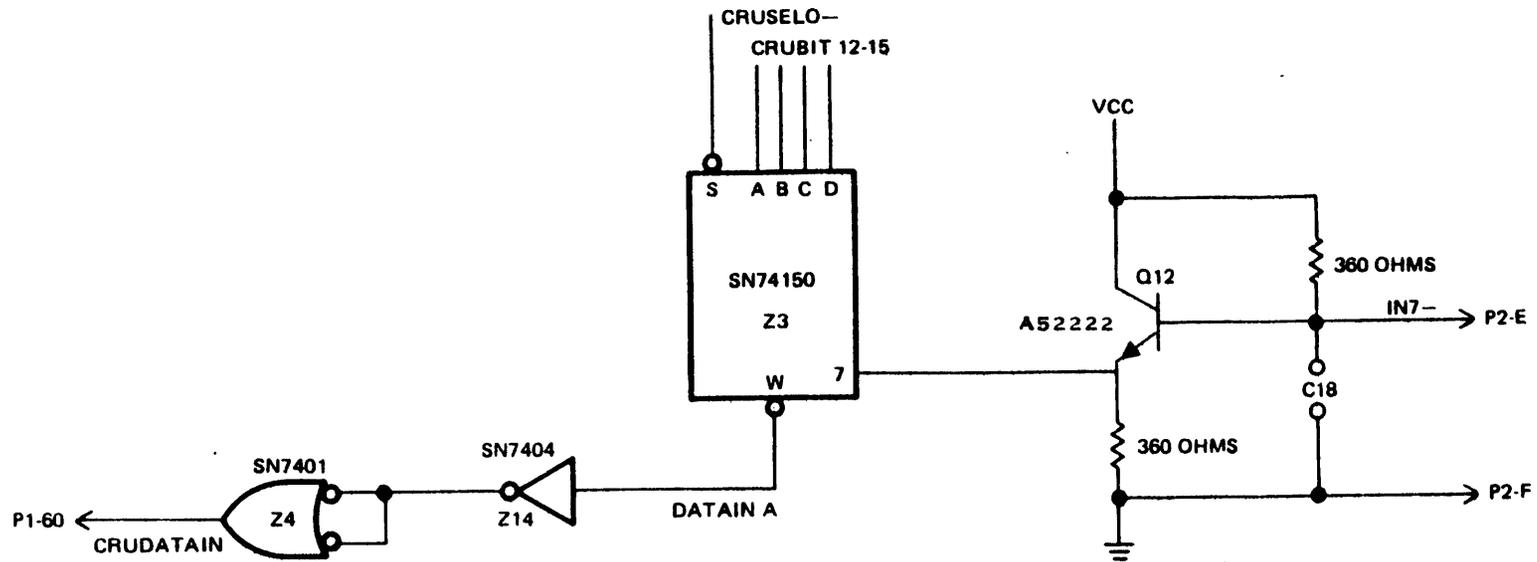

4.2.3 CONTROL AND TRANSFER OF DATA. Data is transferred serially between the 16 Input/16 Output Data Module and the CPU by direct program control. CRU instruction execution selects the module in the port addressed by the effective CRU base address register (contents of memory location 87_{16} or $8F_{16}$ plus the CRU base register modifier). The port of the 16 Input/16 Output Data Module is selected when the CRUSELO- signal goes true causing the input multiplexer and the output decoder to be enabled (see figure 4-4).

4.2.4 CRU INPUT TRANSFER OF DATA AND INSTRUCTIONS. When the input multiplexer is enabled it decodes the CRU line address and outputs the data (as the serial signal CPUDATAIN) to the CPU on the input lines of the requested module. The data is not latched except for the instantaneous value written into memory during an STCR instruction. The following four CRU input instructions are described and illustrated in the following paragraphs. Only one of these instructions transfers bits or fields from the 16 Input/16 Output Data Module. The other three instructions branch conditionally on the value of a sensed bit. The instructions are:

- STCR
- BBNE
- TSBX
- XBNE

966366-9701

NOTE: C18 MAY BE ADDED FOR NOISE SUPPRESSION

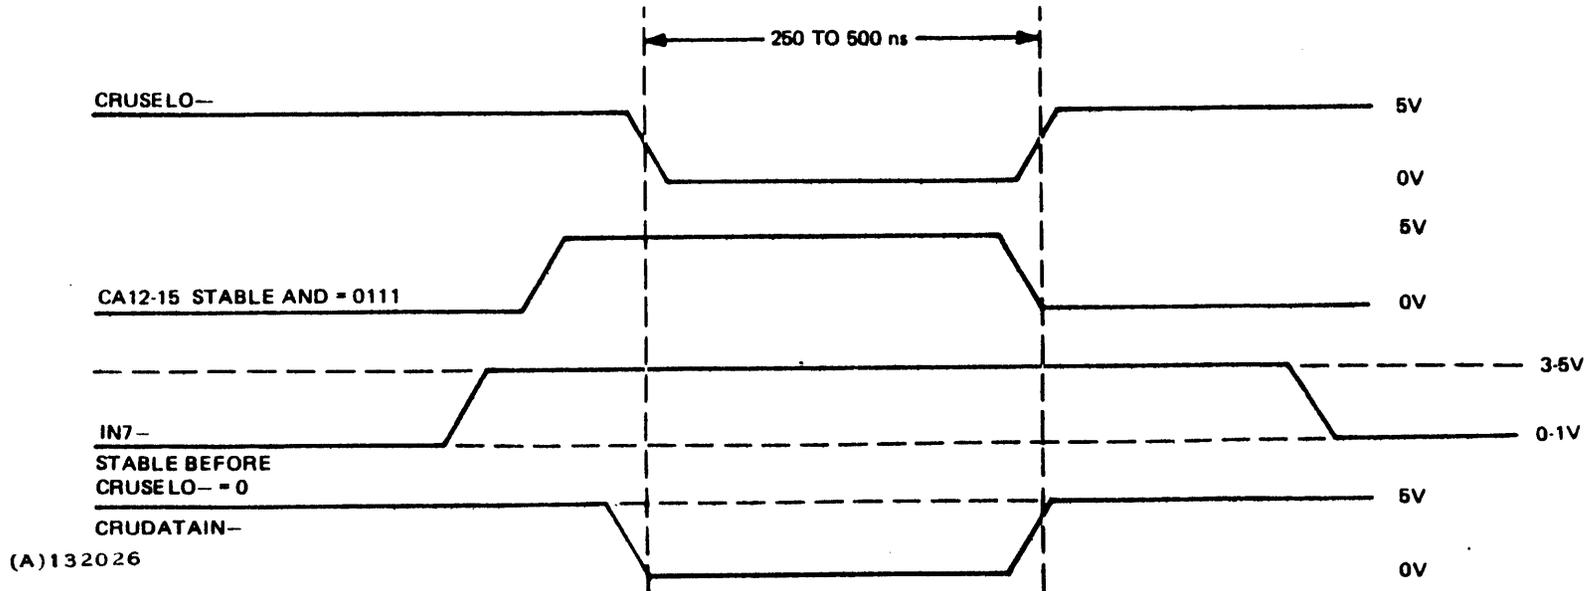

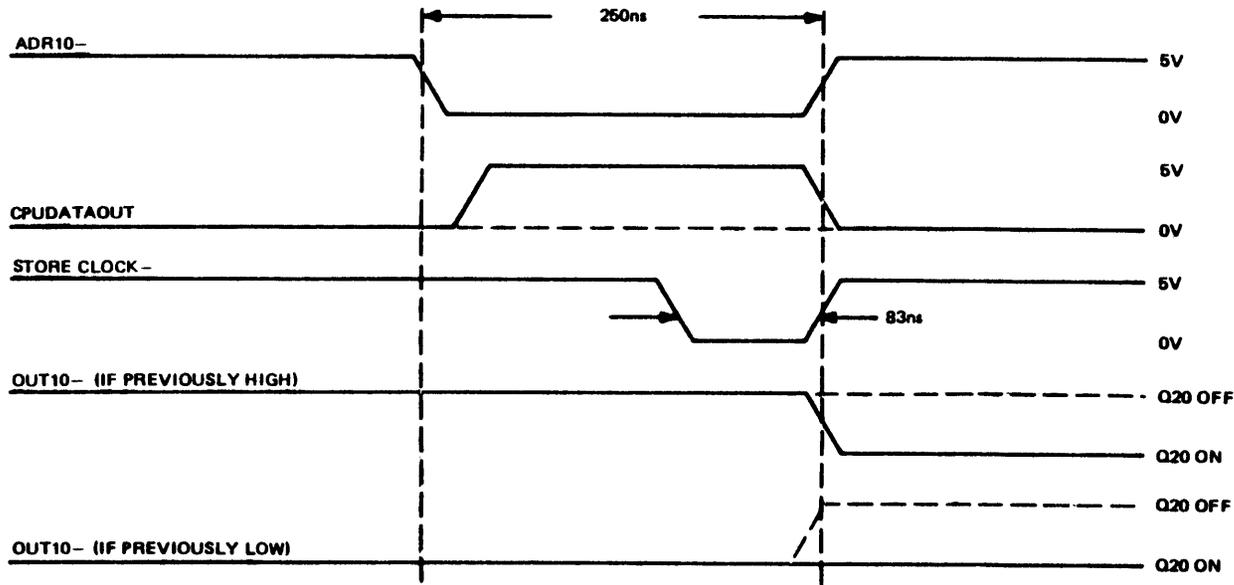

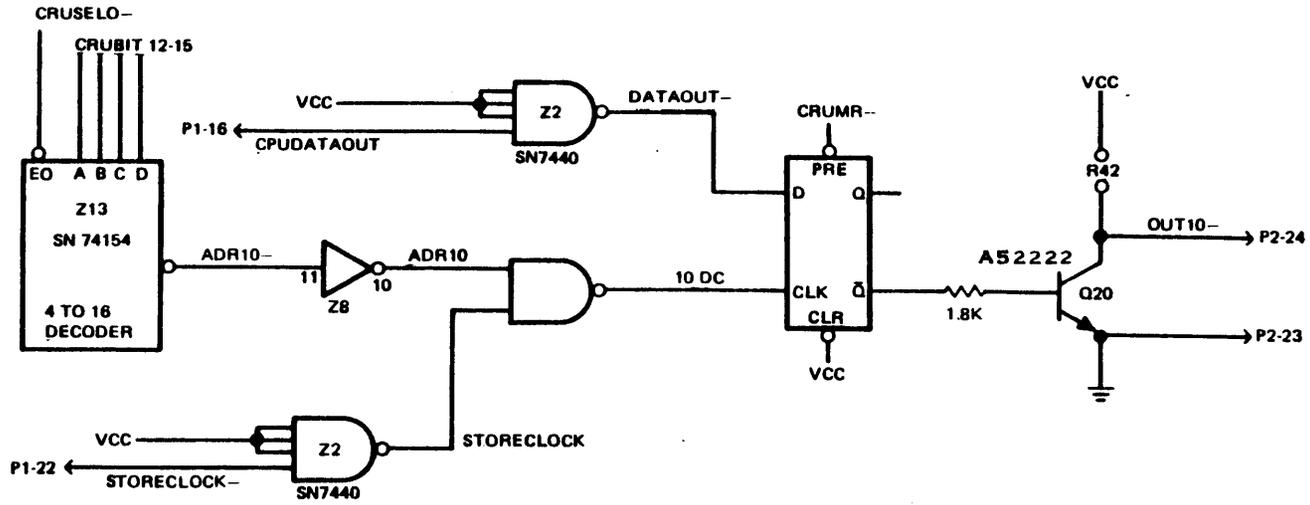

Figure 4-2. Data Module Input Circuit and Timing

(A)132027

Figure 4-3. Data Module Output Flip-Flop and Timing

4.2.4.1 CRU Output Transfer of Data and Instructions. Data is transferred serially between the CPU and the 16 Input/16 Output Data Module on the CPUDATAOUT signal lines. The STORECLOCK- control signal indicates that the CPU output data, CPUDATAOUT, is active and stable. The data is latched by the module at the CRU bit location specified by the line address, CRUBIT 12-15, on the trailing edge (low-to-high transition) of STORECLOCK-. The formats for the following three CRU output instructions are described and illustrated in the following paragraphs. These instructions transfer bits or fields to the 16 Input/16 Output Data Module. The instructions are:

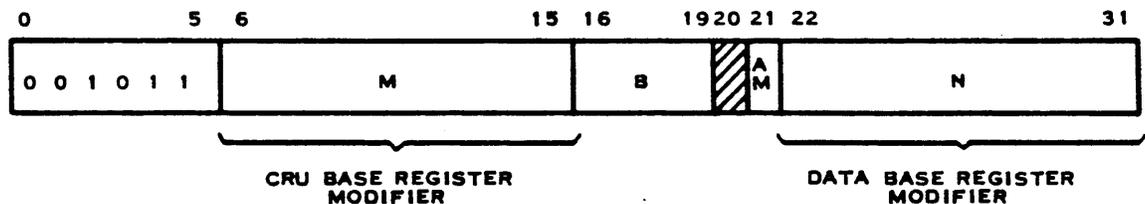

- LDCR
- SETB
- TSBX

4.2.5 CRU INPUT/OUTPUT INSTRUCTION FORMAT. Each instruction is identified by a unique operation code. In these instructions, the operation code is specified in bit position 0 through 5 in the instruction word. Other fields included in the formats of the instructions are:

- M and N address fields
- V1 field - immediate value bit, used to specify one of two possible actions or to perform a bit comparison.
- AM field - bit that specifies whether alternate mode registers are used; base registers for the inactive mode can be used when the other mode is the execution mode.

Base register relative addressing and alternate mode registers are explained in the *Model 960 Computer Assembly Language Programmer's Reference Manual*.

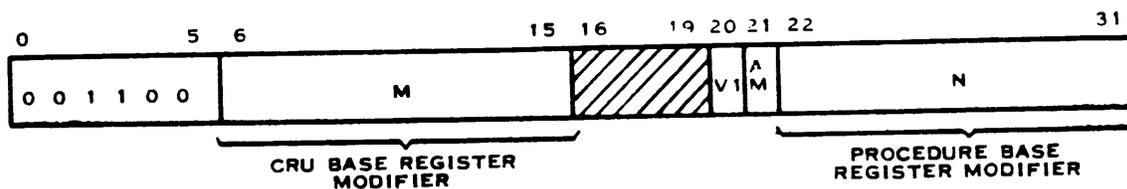

4.2.5.1 STCR Instruction. The format for the Store Communications Register (STCR) instruction is:

The address fields, M and N, contain the CRU base address modifier and the data base register address modifier. Sequential CRU input lines are read and stored as a right-justified bit field in the memory location specified by N plus the contents of the data base register. The CRU input line specified by the contents of the CRU base register plus M is stored as the least significant bit of the field. The B field contains the number of bits to be read and stored in memory. In this field, 0 indicates 16 bits. The bit in the AM field is 0 if execution mode base registers are used and 1 if alternate mode base registers are used.

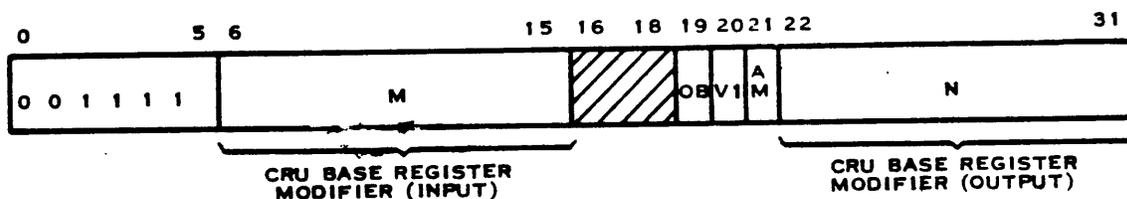

4.2.5.2 BBNE Instruction. The format for the Branch on Bit Not Equal (BBNE) instruction is:

The M field is the CRU base register address modifier, and the N field is the procedure base register address modifier. The addressed CRU input line, specified by the modifier in the M field plus the CRU base register, is compared to the bit in the V1 field. If the comparison fails, the Program Counter (PC) or Event Counter (EC) is loaded with the memory address specified by the modifier in the N field plus the contents of the procedure base register.

If the AM bit is 0, the execution mode base registers are used. If the AM bit is 1, the alternate mode CRU base register is used to calculate the CRU address. The branch address is calculated using the active mode procedure base register and the modifier in the N field.

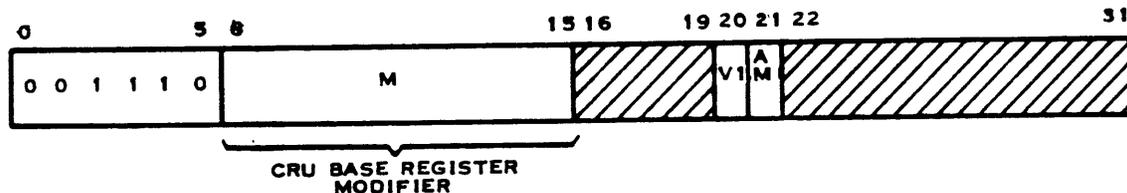

4.2.5.3 TSBX Instruction. The format for the Test Input Bit and Switch Mode or Set Output Bit (TSBX) instruction is:

The addressed CRU input line, specified by the address modifier in the M field plus the contents of the CRU base register, is compared to the bit in the V1 field. If the test fails, the mode is changed. If the test is successful, the value of the OB bit is output to the CRU output line specified by the address modifier in the N field plus the contents of the CRU base register.

If the AM bit is 0, the execution mode CRU base register is used. If the AM bit is 1, the alternate mode CRU base register is used and mode switching is inhibited.

4.2.5.4 XBNE Instruction. The format for the Switch Mode on Bit Not Equal (XBNE) instruction is:

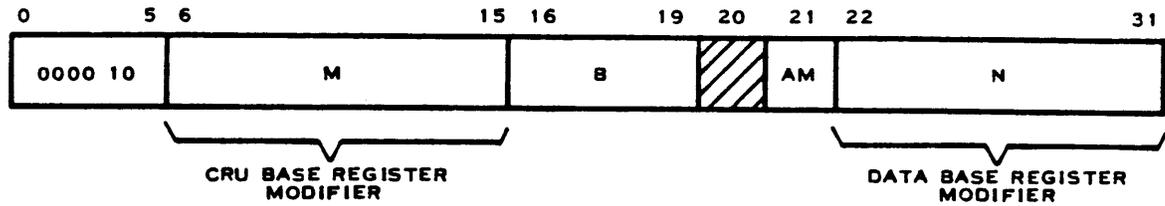

The addressed CRU input line, specified by the address modifier in the M field plus the contents of the CRU base register, is compared to the bit in the V1 field. If the test fails, the mode is changed.

If the AM bit is 0, the execution mode CRU base register is used. If the AM bit is 1, the alternate mode CRU base register is used.

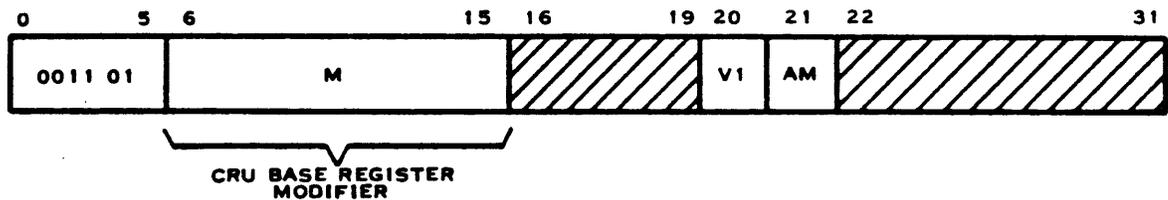

4.2.5.5 LDCR Instruction. The format for the Load Communications Register (LDCR) instruction is:

The address fields, M and N, contain the CRU base register address modifier and the data base register address modifier. The B field contains the number of bits to be read from memory and output to the interface. In this field, 0 indicates 16 bits. The bit in the AM field is 0 if execution mode base registers are being used and 1 if alternate mode base registers are being used. The values in the modifier fields are added to the contents of the corresponding base registers to determine the effective address.

4.2.5.6 SETB Instruction. The format for the Set CRU Output Bit (SETB) instruction is:

The M field is the CRU base register modifier or displacement. The bit in the VI field is used to set the addressed CRU output bit. The VI bit is 0 if the addressed bit is false and 1 if the addressed bit is true. The bit in the AM field is 0 if the execution mode base register is used and 1 if the alternate mode base register is used. The value in the modifier field is added to the contents of the corresponding base register to determine the effective address.

4.3 INTERRUPTS

There are six standard variations of the data module as described in the notes on the schematic diagram that is included in Section VI. The assemblies 214103-0001 and 0004 have 16 inputs and 16 outputs as previously described. Assemblies 214103-0002, -0003, -0005, and -0006 are wired to provide pull-up resistors on the output buffers and to provide the interrupt capability. The 214103-0002 assembly connects the interrupt line as illustrated in figure 4-3. The 214103-0005 assembly interrupt option is wired identically. A transition from high to low on IN15- is squared by two sections of Z4 and differentiated by C28, R38, and R68 to cause a short spike on the clear input of Z10. This latch is the out 15 flip-flop which is used as an interrupt latch. This sets Q- high to indicate the presence of an interrupt. If Q- of the mask flip-flop is also high (interrupt enabled), CRUINT- is forced low, causing a CRU interrupt. Input line 15 is wired in parallel to CRUINT- permitting the source of the interrupt to be program determined.

Figure 4-3 also shows the jumpers for the 214103-0003 assembly. The only difference is the sense of the transition that causes the interrupt. The -0006 assembly is identical to the -0003 assembly with the exception of the input 15 to multiplexer Z3. The interrupt latch output is used directly as the input 15 to multiplexer Z3 on the -0006 assembly, while in the -0003 assembly the multiplexer input is the logical AND of INTERRUPT (15DQ-) and INTERRUPT MASK (14DQ-).

4.4 INPUT CIRCUIT OPERATION

Figure 4-1 illustrates a typical input circuit and a basic timing diagram for the TTL Data Module. The CRU line address (CA12-15) is labeled CRUBIT(12-15) and is true at the logic one level. The CRU rack and module select fields (CA 04-11) are decoded by the CRU interface to provide a port select signal CRUSELO- to each chassis slot. Line address bits CRUBIT(12-15) are applied to the input multiplexer, Z3, along with CRUSELO- which is used as an enable. As long as CRUSELO- is false (high), the module ignores the line address. (Other modules are being selected.) When CRUSELO- is true (low), the input multiplexer, Z3, selects one of the 16 inputs to become signal DATAINA, based on the line address. The 16 input lines are buffered by an emitter-follower stage and terminate at the multiplexer inputs. The external inputs and multiplexer inputs are low-level signals when logically true. Selection of an input signal which is low results in a high output (true) from the multiplexer and becomes the DATAINA signal. DATAINA is inverted twice by Z14 and Z4 to become CRUDATAIN which is a true signal that is wire-ORed with the CRUDATAIN of every other CRU module in the chassis.

4.5 OUTPUT CIRCUITRY OPERATION

Figure 4-2 illustrates a flip-flop output circuit and also includes a basic timing diagram of an output. CRUBIT(12-15) and CRUSELO- are applied to the output decoder Z13, in parallel to the input multiplexer. CRUBIT(12-15) selects the line and CRUSELO- is used as an enable line. The line selected by Z13 (ADR0- to ADR15-) will be true (low). This signal is inverted and applied to a NAND gate along with the STORECLOCK signal from the CRU. The resultant signal (ODC-15DC) is applied to the CLK input of an output storage flip-flop. The value of CPUDATAOUT is clocked into the storage flip-flop and in turn determines the on/off status of the output transistor.

4.6 16 INPUT/16 OUTPUT DATA MODULE CHARACTERISTICS

The electrical and mechanical characteristics of the 16 Input/16 Output Data Module are summarized in table 4-3.

Table 4-3. 16 Input/16 Output Data Module Characteristics

Characteristic	Description
Electrical	
Input lines	16 lines; 0.0 to 1.0 volts for logic 1; 3.0 to 5.0 volts for logic 0.
Input power	5 Vdc; 0.5 amp nominal; current will vary according to resistor schedule.
Maximum input signal voltage	+5.5 volts absolute
Nominal load on external driver	
Standard input	15 milliamps
4 TJ input circuit	1.5 milliamps
Output lines	16 lines; (depending upon configuration) open or 3.0 to 5.0 volts logic 0; 0.0 to 0.4 volts for logic 1.
Output options	a. Collector resistors to +5 Vdc on module b. External voltage source not to exceed +30 Vdc and current limit not to exceed 50 milliamps.
Physical	
Length	7.91 inches
Width	7.0 inches
Bottom connector	80 pins: 40 connector tabs on each side: 0.125- inch spacing between tabs.
Top connector	72 pin: 36 connector tabs on each side: 0.125- inch spacing between tabs.

SECTION V

UNIT MAINTENANCE

5.1 GENERAL

The 16 Input/16 Output Data Module does not require preventive maintenance or adjustments. The diagnostic program (SIODMT), contained in Section VIII, can be used to test individual units suspected of being faulty.

5.2 EQUIPMENT REQUIRED

The following equipment, in addition to the items listed in paragraph 8.2, allow the isolation of any problems in the unit.

- Oscilloscope Tektronix Model 453, or equivalent
- DC Voltmeter

5.3 TROUBLESHOOTING

The following procedure should be used to troubleshoot the unit.

- Ensure that power is being applied to the board.
- Execute SIODMT program. This PDT cannot be used to test Part Number 214103-0006. This module should be temporarily jumpered to function as a -0003 configuration by changing the jumper selecting INPUT 15 to the multiplexer.
- If a data module failure is detected during program execution, the problem can be isolated by checking the individual signals with an oscilloscope.

5.4 TROUBLESHOOTING AIDS

The following aids can be of great help in the troubleshooting of the individual data modules.

- Logic diagram 214104 (see Section VI).
- Top-edge connector pin assignments (table 4-2).
- Top-edge connector symbology (table 4-3).
- Bottom-edge connector pin assignments (table 4-1).
- Input circuit and timing diagram (figure 4-1).
- Output circuit and timing diagram (figure 4-2).
- Interrupt generation logic and signals (figure 4-3).
- Assembly listing for SIODMT program (Section VIII).
- CRU Extender board (TI Part Number 226851-0001).

SECTION VI

ELECTRICAL DRAWINGS, ASSEMBLY DRAWINGS, AND PARTS LIST

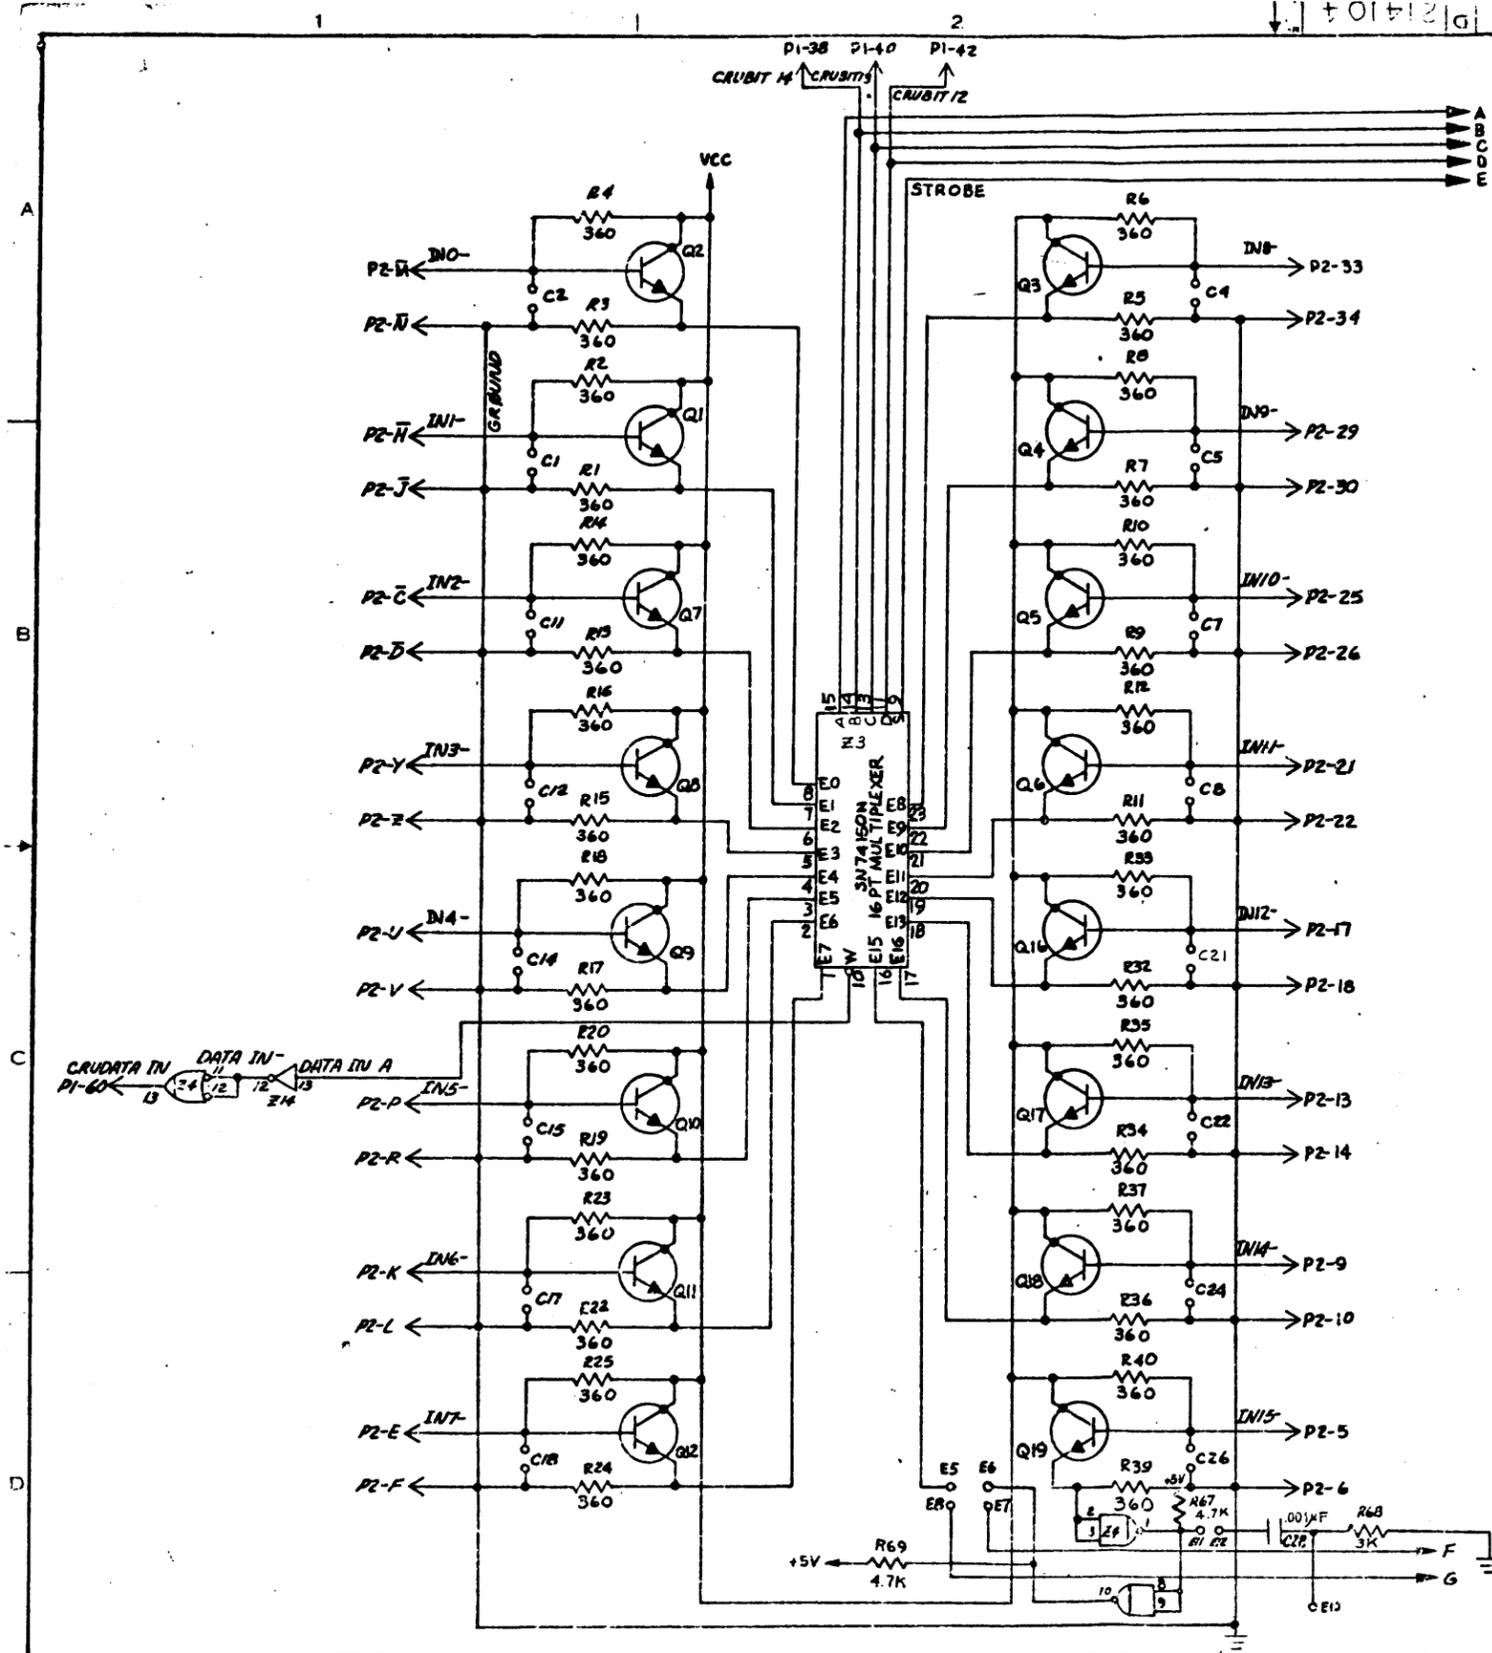

6.1 GENERAL

The electrical drawings, assembly drawings, and parts lists that are required by maintenance personnel to properly service and maintain the 16 Input/16 Output Data Module are included in this section. Parts lists, assembly drawings, and electrical drawings for the computers are contained in the following manuals:

Title	TI Part Number
<i>Model 960A Maintenance Manual Parts List and Assembly Drawings</i>	226750-9707
<i>Model 960A Maintenance Manual Electrical Drawings</i>	226750-9708
<i>Model 960B Maintenance Manual Parts List and Assembly Drawings</i>	942773-9704
<i>Model 960B Maintenance Manual Electrical Drawings</i>	942773-9705

As a convenience to the user a drawing and parts list index appears below. This index lists the electrical drawings, assembly drawing, and parts list (LM).

Description	Drawing	Page
Schematic	214104	6-3
Assembly and Parts List	214103	6-7
Test Kit	966300	6-28
Test Connector	966307	6-33

NOTES:
 UNLESS OTHERWISE SPECIFIED
 1. RESISTANCE VALUES ARE IN OHMS.
 2. RESISTORS ARE .25W ± 5%.
 3. CAPACITANCE VALUES ARE IN MICROFARADS.
 4. TRANSISTORS ARE AST2222.
 5. NETWORKS Z1, Z6, Z9, Z10, Z16, Z17, Z18 AND Z20 ARE SN7474N.
 6. NETWORKS Z5, Z7, Z11, Z15 AND Z19 ARE SN7400N.
 7. NETWORK Z4 IS SN7401N.
 8. NETWORKS Z8, Z12 AND Z14 ARE SN7404N.
 9. NETWORK Z2 IS SN7404N.
 10. NETWORK Z3 IS SN74150N.
 11. NETWORK Z13 IS SN74154N.
 12. FILTER CAPACITORS TO GROUND MAY BE ADDED ON THE PDS PROVIDED, AT INSTALLATION.
 13. FF'S ARE RESET TO OUTPUT DATA.
 14. OUTPUTS ARE NORMALLY ON-OFF TRANSISTOR SWITCHES SINKING UP TO 50MA AND HOLDING OFF UP TO 30 VOLTS. HOWEVER, PROVISION IS MADE ON THE BOARD TO ADD A 3K-OHM RESISTOR FROM EACH COLLECTOR TO VCC.

SECTION VII
LOGIC IMPLEMENTATION LIST

(Not Applicable)

SECTION VIII

PERFORMANCE DEMONSTRATION TEST

8.1 GENERAL

The diagnostic program included in this section for the 16 Input/16 Output Data Modules (TI Part Numbers 214103-0001, -0002, and -0003) is entitled SIODMT (Sixteen Input/Output Data Module Test). Before this test can be executed the reliability of the instruction set and the CPU must be confirmed. The other assemblies of the 214103 data modules can be tested as follows:

- 214103-0004 can be tested as a -0001
- 214103-0005 can be tested as a -0002
- 214103-0006 can be tested as a -0003 (by temporarily jumpering as a -0003)

8.2 RELATED MATERIAL

The following part numbers apply to the equipment and documentation for the test:

966300-0001	Test kit for data module 214103-0001
966300-0003	Test kit for data modules 214103-0002 and 0003
970592-2201	Source input deck (cards) for SIODMT
970592-1201	Object input deck (cards) for SIODMT
970592-1101	Object input tape (paper tape) for SIODMT
970592-9901	Program description for SIODMT
970592-9902	Assembly listing for SIODMT

8.3 EQUIPMENT CONFIGURATION

The minimum equipment required to execute SIODMT is a Texas Instruments Model 960A or Model 960B computer with 4096 words of memory, an input device suitable for the program input source (cards or paper tape) together with its appropriate bootstrap loader, a data module, and a test connector (included in one of the above test kits). The test connector feeds the module output signals back to the corresponding input signals for checkout of both input and output circuits.

8.4 PROGRAM OPERATION

Program Operation consists of the following steps:

1. Initialize the CPU memory, load the primitive and bootstrap loaders. (See Section I of the CPU Performance Assurance Test Manual, TI Part Number 958953-9701).
2. Insert the data module in CRU port F30. If the module must be located elsewhere, modify relative location 4 after the program is loaded.

3. Using the loader, load and execute SIODMT. If a /* record terminates the load operation, the program will immediately begin execution.
4. SIODMT then waits for test selection via the front panel switches. Set DATA switches 4 through 15 on the front panel to the down (zero) position.
5. Set one of the following switch patterns to select one of the tests:

Module	Switch		
	1	2	3
214103-0001	Up	Down	Down
214103-0002	Down	Up	Down
214103-0003	Down	Down	Up

6. Change the position of switch 0 (from down to up, or from up to down) to start the test.
7. Successful execution requires approximately 30 seconds (60 seconds for the -0001 unit) and terminates with a return to the loader.
8. Errors are indicated by a program halt with the instruction $72D2_{16}$ in IA and the relative address of the halt in IB.

If errors occur, refer to the following program listing for an explanation of the failing operation.

0001 * TITLE =SIODMT, 16 INPUT/16 OUTPUT DATA MODULE TESTS
0002 * REVISION =04/12/75 PROGRAMS LDCRUA AND DMX2X3 WERE
0003 * COMBINED TO MAKE SIODMT.
0004 * COMPUTER =960
0005 * ABSTRACT =THIS IS A DIAGNOSTIC FOR 16I/O DATA MODULES
0006 * 214103-0001, 214103-0002, AND 214103-0003.
0007 * TEST SELECTION IS MADE VIA THE FRONT PANEL
0008 * SWITCHES AFTER SIODMT HAS BEEN LOADED. THE
0009 * OPERATOR SHOULD RAISE EITHER PANEL SWITCH
0010 * 1 TO TEST 214103-0001, OR PANEL SWITCH 2 TO
0011 * TEST 214103-0002, OR PANEL SWITCH 3 TO TEST
0012 * 214103-0003. ONCE THE TEST IS SELECTED PANEL
0013 * SWITCH ZERO SHOULD BE TOGGLED TO INDICATE TO
0014 * SIODMT TO READ THE PANEL SWITCHES. IN OTHER
0015 * WORDS PANEL SWITCH ZERO SHOULD BE RAISED OR
0016 * LOWERED DEPENDING UPON ITS ORIGINAL POSITION.
0017 * CALL =SIODMT IS AN INDEPENDENT, STAND ALONE, RELOCAT-
0018 * ABLE, SAL960 PROGRAM.
0019 * STATISTICS=CRU ADDRESS OF THE DATA MODULE IS X'0F30'.
0020 * ERROR DETECTION RESULTS IN A PROGRAMMED HALT
0021 * WITH THE SAL960 OUTPUT LISTING ADDRESS OF THE
0022 * FAILURE IN THE IB REGISTER.
0023 *
0024 * TEST 1: REQUIRES TOP EDGE CONNECTOR 966307-1
0025 *
0026 * THIS TEST PERFORMS 232200 LOAD/STORE
0027 * CRU TESTS. INCLUDED ARE TESTS OF ALL
0028 * POSSIBLE FIELD WIDTHS WITH ALL POS-
0029 * SIBLE BIT PATTERNS FOR EACH WIDTH.
0030 *
0031 * TEST 2: REQUIRES TOP EDGE CONNECTOR 966307-3
0032 *
0033 * ONE RUN OF THIS TEST INCLUDES THE
0034 * LOADING AND STORING OF ALL POSSIBLE
0035 * BIT PATTERNS TO ADDRESSES 0 THRU 14
0036 * AND GENERATING 32768 INTERRUPTS USING
0037 * OUTPUT LINE ZERO. THE MASK BIT IS ALSO
0038 * TESTED.
0039 *
0040 * TEST 3: SAME AS TEST 2.

ALPHABETICAL INDEX

ALPHABETICAL INDEX

INTRODUCTION

The following index lists key words and concepts from the subject material of the manual together with the area(s) in the manual that supply major coverage of the listed concept. The numbers along the right side of the listing reference the following manual areas:

- Sections - References to Sections of the manual appear as "Section x" with the symbol x representing any numeric quantity.
- Appendixes - References to Appendixes of the manual appear as "Appendix y" with the symbol y representing any capital letter.
- Paragraphs - References to paragraphs of the manual appear as a series of alphanumeric or numeric characters punctuated with decimal points. Only the first character of the string may be a letter; all subsequent characters are numbers. The first character refers to the section or appendix of the manual in which the paragraph is found.
- Tables - References to tables in the manual are represented by the capital letter T followed immediately by another alphanumeric character (representing the section or appendix of the manual containing the table). The second character is followed by a dash (-) and a number:

Tx-yy

- Figures - References to figures in the manual are represented by the capital letter F followed immediately by another alphanumeric character (representing the section or appendix of the manual containing the figure). The second character is followed by a dash (-) and a number:

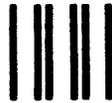

Fx-yy

- Other entries in the Index - References to other entries in the index are preceded by the word "See" followed by the referenced entry.
