TXDS Object Diskettes
- 949617-9701 Link Editor Reference Manual, Issue dated  
15 October 1978

↓

TXDS release 2.3.0 is now available. The purpose for this release is to 1) fix the major known problems, and 2) modify the header information to include the release number, version number, ECN number, and the date the utility was released.

The corrections made to each utility are:

TXMIRA - A jump instruction can now be used after an AORG directive without receiving a syntax error message. If no end directive is found in the source input, one will be provided and a warning message printed in the list file.

TXCCAT - Two new capabilities were added. The first will allow an ANSI standard print file to be correctly copied to a print device. The "AF" option will direct the utility to use the first character of each record as an ANSI carriage control character. The second will allow a user to abort the utility at any time in the process. In order to use this feature, a special system must be generated which include the EVENTK task to process the event key SVC.

GENTX - Changes were made to this utility to support the new TX990 updates.

TXPROM - Changes were made to correct all known problems, and speedup the time required to produce some of the proms.

BACKUP - Changes were made to correct all known problems.

BNPFHL - Changes were made to correct all known problems.

IBMUTL - Was changed to support multi-volume diskettes.

All other utilities were modified to contain a copyright statement as part of the object in the form of a text string.
