00F 00 kF

6 00F 00 qF

ro

00F 00 rF

Locations q + j (j = 0, 1, ..., 10) contain the difference equation coefficients  $a_i$ ,  $b_i$ ,  $c_i$ ,  $d_i$ , the differential equation coefficients,  $A_i$ ,  $B_i$ ,  $C_i$ ,  $D_i$ , (i = 0, 1, ..., n), the increment  $\Delta$  (x) (886), and a temporary storage (986). The differential equation coefficients, A,  $B_i$ ,  $C_i$ ,  $D_i$ , calculated by the auxiliary routine, must be stored in locations 486, 5S6, 6S6, and 7S6 respectively. Locations r+j (j = 0, 1, ..., 7) must contain the length of the range of x, L, and the boundary equation coefficients E, F, G, H, K, M expressed as floating point numbers, at the start of code FA 1. The quantities L, E, F, G, H, K

PROGRAM PARAMETER

8 00F 00 nF

n is the number of sub-intervals into which the range of x is divided.

and M are to be stored in locations S7, 1S7, 2S7, 3S7, 4S7, 5S7, and 6S7 re-

DESCRIPTION

7

Over an interval of length L at equally spaced points,  $x_i$  (i = 0, 1, ..., n), this routine will give the solution of the differential equation,

$$Ay'' + By'' + Cy = D_{y}$$

spectively.

with the given boundary conditions,

$$\mathbf{E}\mathbf{y}^{*} + \mathbf{F}\mathbf{y} = \mathbf{G}]_{\mathbf{x} = \mathbf{x}_{0}}$$

and

$$Hy^{t} + Ky = M]_{x=x_{m}} = n\Delta x + x_{0}$$

where A, B, C, D, E, F, G, H, K and M are functions of x, the independent variable.

An open subroutine, written using interpretive orders, must be provided starting at location g. It is to evaluate the coefficients A, B, C and D for a given x,  $x_0 \le x \le n \Delta x + x_0$ , of the differential equation. These calculated coefficients A, B, C and D must be stored successively starting at Location 456. This auxiliary subroutine must be left with the word

8K 1F

83 (address of the 8th word of Code Fal) F.

NOTE:  $\Delta x$  is available for use in the auxiliary subroutine.  $\Delta x$  is stored in 856.

METHOD: This routine first calculates the coefficients of the difference equations,

$$a_{i} y_{i+1} + b_{i} y_{i} + c_{i} y_{i+1} = d_{i}$$
  $i \neq 0, n$ 

$$a_{0} y_{1} + b_{0} y_{0} = d_{0}$$

$$b_{n} y_{n} + c_{n} y_{n-1} = d_{n}$$

from the coefficients of the differential equations. The following equations are used to calculate  $a_i$ ,  $b_i$ ,  $c_i$  and  $d_i$  ( $0 \le i \le n$ );

$$a_{i} = A_{i} + B_{i} \Delta x/2$$

$$b_{i} = C_{i} \cdot \Delta x^{2} - 2 A_{i} \qquad \text{for } i \neq 0, n$$

$$c_{i} = A_{i} - B_{i} \Delta x/2 \qquad \Delta x = L/n$$

$$d_{i} = D_{i} \Delta x^{2}$$

$$a_{0} = A_{0} E_{0}$$

$$b_{0} = (E_{0}C_{0} - F_{0}B_{0}) \cdot \Delta x^{2}/2 + A_{0}F_{0} \cdot \Delta x - A_{0} E_{0}$$

$$c_{0} = 0$$

$$d_{0} = A_{0}G_{0} \Delta x + (E_{0}D_{0} - B_{0}G_{0}) \Delta x^{2}/2$$

$$a_{n} = 0$$

$$b_{n} = (K_{n}B_{n} - C_{n}H_{n}) \Delta x^{2}/2 + A_{n}H_{n} + A_{n}K_{n} \Delta x$$

$$c_{n} = -A_{n}H_{n}$$

$$d_{n} = A_{n}M_{n} \cdot \Delta x + (B_{n}M_{n} - H_{n}D_{n}) \Delta x^{2}/2$$

At each step, these coefficients are stored in the four locations starting with location q. Then this routine evaluates the following formulae:

when  $i=0,\ldots,n$  and  $r_1=0=r_1\cdot \beta_0$  is calculated first and stored in location k+1. Then  $r_0$  is calculated and stored in location k+n+3. Finally  $r_0$  is calculated and stored over  $r_0$  in location  $r_0$ . During the next time thru the loop  $r_1$ ,  $r_1$  and  $r_1$  are calculated and stored in locations  $r_1$ ,  $r_2$ ,  $r_3$ ,  $r_4$ ,  $r_5$ ,  $r_6$ , and  $r_6$  have been calculated and stored. At this stage, the  $r_1$  are stored in locations  $r_1$ ,  $r_2$  are stored in locations  $r_1$ ,  $r_2$  are stored in locations  $r_3$ . When this has been done, the routine calculates the solution using the formula

$$y_{ij} = z_i - v_i z_{i+1}$$
  $i = n, ..., 0.$ 

where  $y_{n+1} = 0$ . These solutions,  $y_i$  are stored over the  $\mathcal{T}_i$  in locations k + n + 3 thru k + 2n + 3.

NOTE: Incorporated within the routine is a test to determine if  $\beta_i$  = 0. When  $\beta_i$  = 0, 1/4 x 10<sup>-36</sup> is stored in place of this  $\beta_i$  = 0.

The method was adapted by S. Gill from a process used by L. Fox (L. Fox and H. H. Robertson; Automatic Digital Computation Symposium, National Physical Laboratory, England, March 1953. Paper 19, pp. 5, 6).
