Overview

This guide provides the information you need to take advantage of the terminal's programmable features. How you control the terminal will depend on your host and programming language. Refer to your language manual for details on coding terminal commands.

This guide supplements the *WY-370 User's Guide*, which contains the basic information necessary to install, set up, and operate the terminal.

WHAT YOU'LL FIND IN THIS GUIDE

Chapters 1 through 10 describe the commands supported by the terminal in the *native* (Wyse 370) and other ANSI personalities. Command descriptions assume basic familiarity with ANSI terminal programming concepts. The guide is organized as follows:

- Chapter 1 introduces terminal features and programming procedures.
- Chapter 2 describes the commands that set and reset the terminal's functional modes, select terminal personalities, and control miscellaneous terminal processing.
- Chapter 3 explains function key programming and numeric keypad functions.
- Chapter 4 discusses how to display predefined character sets and how to design and load softfonts.
- Chapter 5 describes the commands that control the screen display, including a detailed discussion of how to combine colors and display attributes.
- Chapter 6 discusses the commands that divide display memory into pages, split the screen, and address the cursor in multiple pages.
- Chapter 7 describes standard cursor movement commands.
- Chapter 8 describes the editing commands that insert, delete, or erase data and set or clear tab stops.

- Chapter 9 discusses the commands that control the sending of data to the host and to the printer and other auxiliary devices.
- Chapter 10 explains terminal status report requests and responses.

The commands in Chapters 1 through 10 are summarized under functional categories in Appendix F, “ANSI Command Summary.” A “Quick Reference Guide” (Appendix J) lists the same commands in ASCII order. Finally, a “Command Index” lists these commands alphabetically by mnemonic and references the page where the main discussion of each command can be found.

Appendix G, “Programming in Wyse 350 Personality,” describes the commands supported by the terminal in Wyse 350 personality and summarizes those supported in other ASCII personalities.

Appendix H summarizes the commands supported in TEK 4010/4014 graphics personality.

The remaining appendixes provide technical reference material, including character sets, ASCII code conversions, key codes, local keyboard commands, and summaries of the control codes supported by the terminal.

CONVENTIONS AND SYNTAX NOTATION

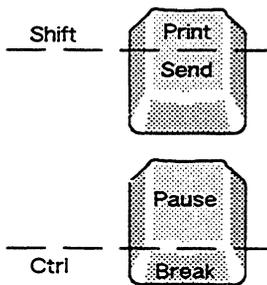

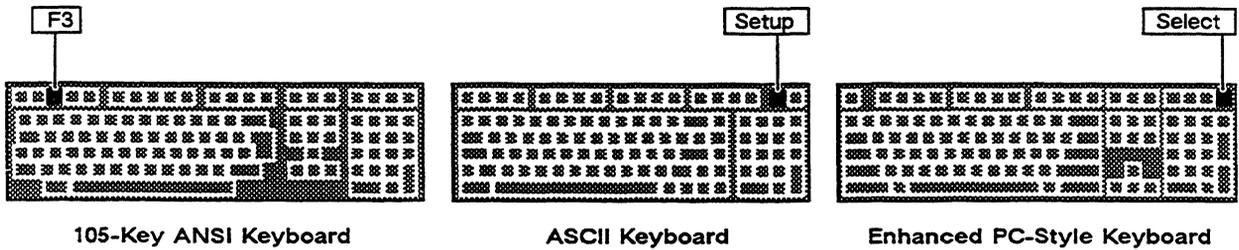

The term *personality* refers to a combination of operating characteristics typical of a particular terminal command set (e.g., *VT320/VT220 personality*).

Hexadecimal values are indicated by the letter H. For example, 63H is 63 hexadecimal (0110 0011 binary).

Key Functions

The names of keys are represented by boxed symbols or letters, for example, Return. Key functions described in the text are presented as follows:

- The symbol for the key on the 105-key ANSI keyboard is shown first, followed by key symbols in parentheses that are different for the other keyboards. For example, F3 (Setup, Select) identifies the following keys:

- When a key symbol in the text refers to one of two names on a key on the keyboard, the action of another key may be implied. For example, on the ASCII keyboard, `[Print]` is the upper name on the key that is also marked `[Send]`. When `[Print]` appears in the text, it indicates the key pressed simultaneously with `[Shift]`; when `[Send]` appears in the text, it means the same key by itself (unshifted). Or, on the Enhanced PC-style keyboard `[Break]` appears on the front face of the key that is also marked `[Pause]`. On this keyboard, the key functions named `[Break]` and `[Sys Rq]` are activated when `[Ctrl]` is pressed simultaneously with that key. Therefore, when `[Break]` appears in the text, it means the key pressed together with `[Ctrl]`; when `[Pause]` appears in the text, it means the same key by itself.
- When necessary, an italic notation follows the key name to identify a specific location on the keyboard. For example, `[5] kpd` identifies the number key on the numeric keypad at the right side of the keyboard, and `[Alt] left` identifies the `[Alt]` key on the left side of the Enhanced PC-style keyboard.

Command Sequences

Unless otherwise noted, the commands described in this guide can be entered from the keyboard as well as coded into your program.

Control codes are shown with the notation CTRL indicating the `[CTRL]` key.

Command sequences appear in the text with a space between each character to make the command easier to read. Don't enter the spaces in your program statements. A space character that is part of a command sequence is explicitly shown, for example,

ESC SPACE

Commands are presented in the text with a mnemonic reference followed by a brief description and the command sequence. Mnemonics beginning with *WY* are Wyse private mnemonics; those

beginning with *DEC* are Digital Equipment Corporation private mnemonics; all others are ANSI mnemonics.

Command sequences are given in 8-bit format. Whenever an 8-bit control character is shown in the command line—for example, the control sequence introducer CSI—an equivalent 7-bit escape sequence can be used. (Equivalent 7-bit escape sequences are listed in Table 1-1 in Chapter 1.)

Within a command sequence, parameters are shown in italics. *Pn* signifies a numerical parameter value; *Ps* signifies a selective parameter value. Parameter values are listed immediately following the command.

Introduction

TERMINAL FEATURES

This chapter describes the main features of the terminal, discusses its operating modes and available personalities, and introduces the command sequences that determine how it displays and processes data.

This flexible, high-performance alphanumeric and graphics color terminal sets new standards in terminal design for user productivity. Some of these design features are

- Modular architecture
- Dual-session capability for running two applications simultaneously
- High-resolution 16x20 character cell for 1280x520 text resolution
- 64 independently selectable foreground and background colors and user-selectable character attributes
- Three pages of display memory (up to four pages per session with memory expansion) and 26- or 52-line by 80-, 132-, or 161-column display
- Pulldown setup menus with real-time help messages
- Integrated desktop accessories, including a business calculator (modeled after the HP-18C Business Consultant calculator), calendar, and alarm clock
- Multiple keyboard selections

The terminal is available in two models:

- A North American model with English, French Canadian, and Latin American keyboard language support
- An international model that supports 16 keyboard languages

Operating Modes

The terminal has four operating modes: setup, on-line, local, and WyseWorks.

- Setup mode, selectable only from the keyboard (**F3**, **Setup**, **Select**), allows you to configure the terminal's operating parameters, redefine colors and display attributes, set tab stops, define an answerback message, and redefine many keys on your keyboard.
- On-line mode, selectable in setup mode (On-Line/Local parameter), allows the terminal to communicate with the host.
- Local mode, selectable in setup mode (On-Line/Local setup parameter), allows you to experiment with the terminal's operating characteristics without physically disconnecting it from the host system. In local mode, data from the keyboard is sent only to the terminal, not to the host. Data coming from the host is ignored.
- WyseWorks mode, selectable from the keyboard (**Ctrl** **F3**, **Ctrl** **Setup**, **Ctrl** **Select**), allows you to use the terminal's desktop accessories: a business calculator, a datebook calendar, and an alarm clock. See the *WY-370 User's Guide* for a description of WyseWorks mode.

Personalities

The terminal can operate in a number of different *personalities*, selectable in setup mode, to allow for smooth interaction with application programs written for typical terminal command sets.

ANSI Personalities

The default personality, Wyse 370, is compatible with American National Standards Institute (ANSI) command functions. It is called the *native personality* because it embodies the set of ANSI-based functions for which the terminal was designed. The native personality is compatible with applications written for many ANSI terminals, including the DEC VT320 and VT220 and compatible terminals.

Other ANSI-compatible personalities are

- VT320/VT220 and VT100 for applications written for the corresponding DEC (Digital Equipment Corporation) and DEC-compatible terminals
- Intecolor 220 for applications written for Intecolor Corporation's ColorTrend 220 and compatible color terminals

The VT52 personality is for use with application programs written for the DEC VT52 terminal.

Graphics Personality

The TEK 4010/4014 personality is designed to support Tektronix-compatible vector graphics applications.

ASCII Personalities

The terminal operates according to ASCII-based (American Standard Code for Information Interchange) command functions when an ASCII personality is selected in setup mode. The following are the terminal's ASCII personalities and the terminals they represent:

- Wyse 350 (WY-350 color terminal)
- TVI 950 (TeleVideo 950 terminal)
- Esprit III (Esprit III color terminal)
- ADDS A2 (ADDS Viewpoint A2 terminal)

Display Features

Terminal display features include

- 16x16 character cell (74 Hz) and 16x20 character cell (60 Hz)
- 64 independently selectable foreground and background colors and user-selectable character display attributes
- Line attributes, which allow you to display characters twice as wide, twice as high, or twice as wide and twice as high as normal characters
- Pulldown setup menus with real-time help messages
- Screen display with 24, 25, 50, or 51 data lines and 80, 132, or 161 columns

Keyboard Features

The keyboards supported by the terminal can be generally described as having four key groups.

Main Keypad

The standard alphanumeric keys on the main keypad send the ASCII characters shown on the keycaps. When pressed together with **Ctrl**, some of these keys send control codes that direct the terminal to perform special functions (see Appendix E). The codes sent by the other keys depend on the terminal's current personality and on the settings of some of the keyboard setup parameters.

Editing Keypad

The editing keypad includes the cursor (arrow) keys and special editing keys. The codes sent by these keys depend on the terminal's current personality (see Appendix D).

Numeric Keypad

The numeric keypad contains numeric and arithmetic symbol keys and some special keys. The codes sent by these keys depend on the terminal's current personality (see Appendix D).

User-Definable Keys

The number and location of the function keys (**F1**, **F2**, etc.) depend on your keyboard. Most of these keys and many editing keys are user-definable in setup mode or with a command sequence (see Chapter 3 and Appendix G). If the keys haven't been redefined, they send the default codes listed in Appendix D.

Communications Modes

In on-line mode, the terminal communicates with the host according to the setting of the Communications Mode setup parameter (Port setup menu). Four modes of communication are possible between the terminal and the host: full duplex, half duplex, block, and half-duplex block. Figure 1-1 illustrates the flow of data in these modes.

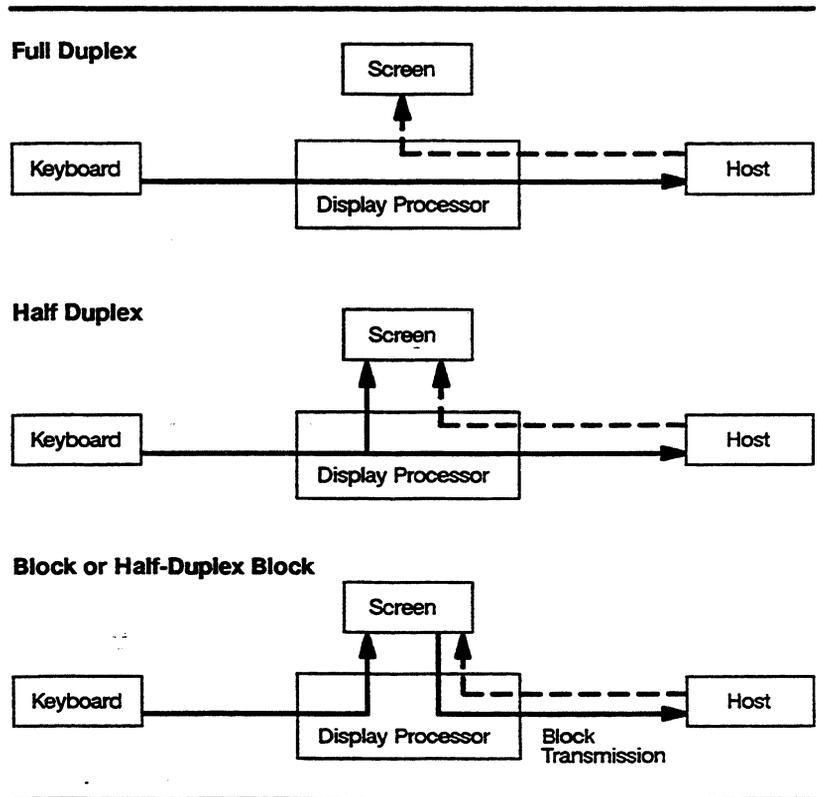

In *full-duplex* mode, data sent by the terminal is not displayed on the screen unless the host echoes it. In practice, most application programs do instruct the host to echo the data to the screen for the user to monitor.

In *half-duplex* mode, keyboard data is sent to the screen at the same time as to the host. Half-duplex mode should not be selected unless required—characters will display twice if the host also echoes the data to the screen.

In *block* mode, keyboard data is sent to the terminal only and is displayed on the screen. Data can be received from the host at any time and is displayed when received.

Half-duplex block mode is used for some modem communications and is equivalent to block mode.

Figure 1-1 Communication Modes

PROGRAMMING COMMAND SEQUENCES

The terminal responds to control codes and command sequences received from the host in on-line mode or from the keyboard in local mode. These control codes and command sequences determine how the terminal displays and processes data.

The terminal recognizes a large number of the control codes and command sequences specified in the ANSI x3.64 standard, plus numerous additional commands. In general, the terminal ignores commands that it doesn't support; however, sending codes other than those supported may cause unpredictable results.

As defined in the ANSI (American National Standards Institute) and ISO (International Organization for Standardization) standards, characters are classified as *graphic* or *control* characters. Graphic characters include alphanumeric characters, punctuation

marks, and any other characters that are normally displayed on the screen. Control characters, which are not normally displayed, are interpreted by the terminal as actions to be performed—for example, the CR control character causes the terminal to execute a carriage return.

- **Note** In controls display mode, the terminal displays symbolic representations of control characters instead of acting on them. This is useful for debugging programs.

The terminal's graphic and control characters are arranged into *character sets*, which are illustrated in Appendix A in the form of code tables that show the decimal and hexadecimal code for each character.

Control Characters

Two basic sets of control characters are recognized by the terminal:

- 7-bit control characters, designated as C0 (the eighth bit always 0, only seven bits defining the character)
- 8-bit control characters, designated as C1 (the eighth bit always 1, all eight bits defining the character)

C0 Control Characters

The terminal recognizes the C0 control characters in all terminal personalities and data transmission modes.

Table E-1 in Appendix E lists all the ANSI C0 control characters and identifies the actions of those supported by the terminal. C0 control characters can be generated from the keyboard by holding down the CTRL key while simultaneously pressing the alphanumeric key identified in Table E-1.

C1 Control Characters

The terminal recognizes the C1 control characters only in the native and VT320/VT220 8-bit personalities and only when the Data/Parity Bits setup parameter is set for 8-bit data.

Table E-2 in Appendix E lists all the ANSI C1 control characters and identifies the actions of those supported by the terminal. C1 control characters can be generated from the keyboard by sending the equivalent 7-bit escape sequence (press **Ctrl** **[** followed by the alphanumeric key corresponding to the ASCII character identified in Table E-2).

Control Functions

The terminal recognizes the C1 control characters only in an 8-bit environment. However, you can select their functions indirectly in a 7-bit environment by use of 7-bit *code extensions* specified in the ANSI x3.64 standard and described under “Escape Sequences” in the next section.

Some of the functions of the single-byte control codes listed in Tables E-1 and E-2 are directly related to the terminal’s processing of text (e.g., CR, HTS, IND). Others function as *introducers* (e.g., ESC, CSI, SS2) or *string delimiters* (DCS, ST) for multiple-character command sequences that provide many more control functions.

Multiple-Character Control Functions

Most of the commands described in the remaining chapters in this manual are multiple-character control functions. There are three basic types:

- 7-bit escape sequences
- 8-bit control sequences
- Device control strings

Escape Sequences

Command sequences introduced by the C0 control character ESC are called *escape sequences*. An escape sequence consists of one or more ASCII graphic characters preceded by the ESC control character. For example, the sequence

ESC ! p

performs a terminal mode reset.

Escape sequences can be used in either a 7-bit or 8-bit environment.

As provided in the ANSI standard, you can use escape sequences as 7-bit code extensions to incorporate the functions of the 8-bit (C1) control characters into programs that must be compatible with a 7-bit environment. Table 1-1 lists the equivalent 7-bit escape sequence for each of the C1 control characters recognized by the terminal.

Table 1-1 8-Bit Control Characters with 7-Bit Equivalents

Name	8-Bit Control Character	7-Bit Escape Sequence
Index	IND	ESC D
Next line	NEL	ESC E
Horizontal tab set	HTS	ESC H
Reverse index	RI	ESC M
Single shift 2	SS2	ESC N
Single shift 3	SS3	ESC O
Device control string	DCS	ESC P
Control sequence introducer	CSI	ESC [
String terminator	ST	ESC \
Operating system command	OSC	ESC]
Privacy message	PM	ESC ^
Application program command	APC	ESC _

Control Sequences

Control sequences are multiple-character command sequences introduced by the C1 control character CSI (*control sequence introducer*). For example, the sequence

CSI 5 W

clears all tab stops. Control sequences often contain variable parameters indicated by P_n or P_s . P_n signifies a direct numerical value, such as the number of a line or column position on the screen. P_s signifies an action or alternative meaning; for example, the sequence

CSI 49 ; P_s w

selects a background color, where P_s is a decimal value that stands for a color name.

The C1 control character CSI can be expressed by ESC [in a 7-bit environment.

Device Control Strings

Device control strings are multiple-character command sequences introduced by the C1 control character DCS (*device control string*) and terminated by the C1 control character ST (*string terminator*). A device control sequence always includes a data string—for example, a programmable key definition or a terminal report.

In a 7-bit environment DCS can be expressed by ESC P and ST by ESC \.

2

Controlling Functional Modes and Terminal Processing

INTRODUCTION

This chapter discusses

- Set/reset commands for functional modes
- Selecting terminal personalities
- Selecting 7- or 8-bit transmission
- Setting the date and time
- Processing commands
- Resetting the terminal
- Testing the terminal

SETTING AND RESETTING FUNCTIONAL MODES

Many specific terminal functions can be turned on (set) or off (reset) by set mode (SM) or reset mode (RM) control sequences called *functional mode commands*.

Functional mode commands have two versions, one with a ? character immediately following the control sequence introducer CSI and one without the ? character.

SM	Set functional modes	(1) CSI <i>P_s</i> ; ... ; <i>P_s</i> h or (2) CSI ? <i>P_s</i> ; ... ; <i>P_s</i> h
RM	Reset functional modes	(1) CSI <i>P_s</i> ; ... ; <i>P_s</i> l or (2) CSI ? <i>P_s</i> ; ... ; <i>P_s</i> l

where *P_s* is a parameter that selects the mode to be set or reset

h indicates set mode (SM)

l indicates reset mode (RM)

Note The final character in the RM sequence is a lowercase L.

Table 2-1 lists the *Ps* parameter values for the two versions of the SM and RM commands.

Table 2-1 Parameter Values for SM and RM Commands

(1) <i>Ps</i> ¹	Mode	Mnemonic	Default ²	(2) ? <i>Ps</i> ¹	Mode	Mnemonic	Default ²
2	Keyboard lock	KAM	Off	1	Cursor key application	DECCKM	NVR
3	Monitor	CRM	NVR	2	VT52 ⁵	DECANM	NVR
4	Insert	IRM	Off	3	132 column ⁶	DECCOLM	NVR
12	Local echo disable	SRM	NVR	4	Scrolling	DECSCLM	NVR
13	Control execution disable	FEAM	NVR	5	Reverse screen	DECSCNM	NVR
16	Transfer termination	TTM	NVR	6	Origin	DECOM	Off
20	Newline	LNМ	NVR ³	7	Autowrap	DECAWM	NVR
30	Display disable	WYDSCM	Off	8	Key autorepeat	DECARM	NVR
31	Status line display	WYSTLINM	NVR	10	Block mode	DECEDM	NVR
32	Screen saver	WYCRISAVM	NVR	18	Print form feed	DECPFF	NVR
33	Steady cursor	WYSTCURM	NVR	19	Print extent	DECPEX	NVR
34	Underline cursor	WYULCURM	NVR	25	Text cursor enable	DECTCEM	NVR
35	Width change clear disable	WYCLRM	NVR	38	TEK 4010/4014 ⁷	WYTEK	NVR
36	Delete key redefinition	WYDELKM	NVR	42	National replacement character set ⁸	DECNRCM	NVR
37	Nonerasable area transmit	WYGATM	NVR	60	Horizontal panning ⁹	DECHCCM	NVR
38	Send full screen	WYTEXM	NVR	61	Vertical panning ⁹	DECVCCM	NVR
40	Extra data line	WYEXTDM	NVR	64	Page coupling ⁹	DECPCCM	NVR
42	Wyse 350 ⁴	WYASCII	NVR	66	Keypad application ⁹	DECNKM	NVR
				67	Delete key redefinition ⁹	DECBKM	NVR
				68	Key legend ⁹	DECKBUM	NVR
				80	161 column ⁹	WY161	NVR
				83	52 line ⁹	WY52	NVR
				84	Erasable/nonerasable attribute select ¹⁰	WYENAT	Off
				85	Replacement character color ⁹	WYREPL	Off

- Ps* values are listed in two groups: In the first group are the values for terminal modes that can be set with SM command sequence (1) or reset with RM command sequence (1); in the second group are the values for terminal modes that can be set with SM sequence (2) or reset with RM sequence (2). The latter group is shown as ? *Ps* to indicate that sequence (2) includes a question mark immediately following the control sequence introducer CSI. Up to 16 *Ps* values can be specified (separated by semicolons) in any one SM or RM command sequence.
- Mode status when terminal is turned on or reset. *NVR* (nonvolatile RAM) means that the status depends on the value last saved in battery-backed memory in setup mode.
- Return setup parameter (Keyboard menu, Key Functions submenu).
- Set mode (SM) only.
- Reset mode (RM) only.
- Command is ignored during dual-session operation with a vertically split screen.
- Set mode (SM) only. Command is ignored if the terminal is set up for two sessions.
- Command is ignored if Keyboard Language parameter is set to *U.S.*
- Native and VT320/VT220 personalities only.
- Native personality only. Enables separate assignment of attributes to erasable and nonerasable characters (by the SGR command); when reset, attributes extend to both.

You can specify up to 16 modes in any one SM or RM control sequence by entering multiple parameters separated by semicolons. For example,

CSI 4 ; 20 ; 34 h

selects insert mode, newline mode, and an underline cursor.
Entering the sequence

CSI ? 1 ; 7 ; 80 h

selects cursor key application mode, autowrap mode, and a 161-column display.

Do not combine parameters listed for version (1) of the command with parameters listed for version (2). For example, the sequence

CSI 4 ; 20 ; 80 h

is invalid. To set the three modes represented by these parameters, you need to enter two sequences:

CSI 4 ; 20 h

to set insert and newline modes, and

CSI ? 80 h

to select 161 columns.

- Note** A question mark entered anywhere in an SM or RM sequence makes it a version (2) command.

Table 2-2 lists the functional mode commands under the following functional headings:

Screen Display and Editing Functions

Keyboard Functions

Paging Functions

Cursor Control Functions

Sending and Printing Functions

Processing and Control Functions

Table 2-2 Set/Reset Functional Modes

Mnemonic	Command Sequence	Function
Screen Display and Editing Functions		
DECAWM (Autowrap)	CSI ? 7 h	Set: Automatically wraps characters to the next line after the last position on the line is exceeded. When the cursor exceeds the last position on the last line of the screen, the display scrolls up one line at a time.
	CSI ? 7 l	Reset: Characters do not wrap. Current character at the right margin is replaced with the next received character. (Default)
DECCOLM (132-column)	CSI ? 3 h¹	Set: Displays 132 columns per line if a page of 132 or 161 columns has been defined. Cursor returns to home position and screen is cleared if width change clear disable (WYCLRM) is reset.
	CSI ? 3 l	Reset: Displays 80 columns per line. Cursor returns to home position and screen is cleared if width change clear disable (WYCLRM) is reset. (Default)
DECOM (Origin)	CSI ? 6 h	Set: Designates the top line of the scrolling region as the first line of the active data region.
	CSI ? 6 l	Reset: Designates the top line of the screen as the first line of the active data region, regardless of the defined scrolling region. (Default)
DECSCLM (Scrolling)	CSI ? 4 h	Set: Display scrolls at the smooth scrolling speed of 4 lines per second.
	CSI ? 4 l	Reset: Display jump scrolls as fast as the baud rate allows. (Default)
DECSCNM (Reverse screen)	CSI ? 5 h	Set: Displays background color characters on the foreground color (reverse screen)
	CSI ? 5 l	Reset: Displays foreground color characters on the background color (normal screen). (Default)
IRM (Insert/replace)	CSI 4 h	Set: Displays each received character at the cursor position; moves cursor and all characters to right of cursor one position to the right. Data that moves past the right margin is lost (unless the Page Edit setup parameter has been set to <i>page</i> , in which case the data wraps to the next line).
	CSI 4 l	Reset: Displays each received character at the cursor position, overwriting the current character; moves cursor one position to the right of the new character. (Default)

1. Command is ignored during dual-session operation with a vertically split screen.

Table 2-2 Set/Reset Functional Modes, Continued

Mnemonic	Command Sequence	Function
Screen Display and Editing Functions, Continued		
LNM (Newline)	CSI 20 h	Set: When a LF, FF, or VT character is received, the cursor moves to the first column of the next line. When <input type="button" value="Return"/> (<input type="button" value="Enter"/>) is pressed, the terminal sends both a carriage return (CR) and a linefeed (LF). (Sets Received CR setup parameter to CR and Received LF, Return Key and Enter Key setup parameters to CRLF.)
	CSI 20 l	Reset: When an LF, FF, or VT character is received, the cursor moves to the current column of the next line. When <input type="button" value="Return"/> (<input type="button" value="Enter"/>) is pressed, the terminal sends a CR only. The cursor returns to the first position of the current line. (Sets Received CR, Return Key, and Enter Key setup parameters to CR and Received LF setup parameter to LF.) (Default)
WY52² (52 line)	CSI ? 83 h	Set: Sets 52-line display. Additional memory must be installed for certain line and column combinations (see Chapter 6).
	CSI ? 83 l	Reset: Sets 24-line display. (Default)
WY161² (161 column)	CSI ? 80 h	Set: Sets 161-column display. Additional memory must be installed for certain line and column combinations (see Chapter 6).
	CSI ? 80 l	Reset: Sets 80-column display. (Default)
WYCLRM (Width change clear disable)	CSI 35 h	Set: Screen does not clear when number of displayed columns (80/132/161) is changed.
	CSI 35 l	Reset: Screen clears when number of displayed columns (80/132/161) is changed. (Default)
WYCRTSAVM (Screen saver)	CSI 32 h	Set: Turns off the display when terminal receives no data or keyboard activity for approximately 15 minutes. Pressing any key or receiving new data restores the display. (Default)
	CSI 32 l	Reset: Does not turn off display regardless of elapsed time since data was received.
WYDSCM (Display disable)	CSI 30 h	Set: Blanks the terminal screen.
	CSI 30 l	Reset: Displays data on the screen. (Default)

2. Native and VT320/VT220 personalities only.

Table 2-2 Set/Reset Functional Modes, Continued

Mnemonic	Command Sequence	Function
Screen Display and Editing Functions, Continued		
WYENAT ³ (Erasable/ nonerasable attribute select)	CSI ? 84 h	Set: Enables separate assignment of attributes (SGR) to erasable and nonerasable characters.
	CSI ? 84 l	Reset: Enables attribute assignment (SGR) to extend to both erasable and nonerasable characters. (Default)
WYEXTDM (Extra data line)	CSI 40 h	Set: Designates the bottom line of the screen as an extra data line and sets the bottom scrolling margin to line 25 or 51.
	CSI 40 l	Reset: Sets the bottom scrolling margin to line 24 or 50. (Default)
WYREPL ² (Replacement character color)	CSI ? 85 h	Set: Sets replacement character, used for clearing, erasing, and scrolling, to color of current character's background color.
	CSI ? 85 l	Reset: Sets replacement character, used for clearing, erasing, and scrolling, to background color defined in color map mode. (Default)
WYSTLINM (Status line display)	CSI 31 h	Set: Displays the user status line. (Default)
	CSI 31 l	Reset: Does not display a status line.
Keyboard Functions		
DECARM (Key autorepeat)	CSI ? 8 h	Set: When a key is pressed longer than 0.5 second, the key automatically repeats transmission of the character until released. (Default)
	CSI ? 8 l	Reset: Transmits a character once each time a key is pressed. Holding down a key has no repeating effect.
DECBKM or WYDELKM (Delete key redefinition)	CSI ? 67 h	Set: Generates the BS (backspace) code for unshifted delete key; generates the DEL (delete) code for the shifted delete key.
	CSI ? 67 l CSI 36 l	Reset: Generates the DEL (delete) code for unshifted delete key; generates the CAN (cancel) code for shifted delete key. (Default)
DECCKM (Cursor key application)	CSI ? 1 h	Set: Cursor keys generate application sequences (see Appendix D).
	CSI ? 1 l	Reset: Cursor keys generate ANSI cursor (normal) sequences (see Appendix D). (Default)

3. Native personality only.

Table 2-2 Set/Reset Functional Modes, Continued

Mnemonic	Command Sequence	Function
Keyboard Functions, Continued		
DECKBUM ² (Key legend)	CSI ? 68 h	Set: Keys send data processing character values (when available on keyboard) shown on the right legend of the key.
	CSI ? 68 l	Reset: Keys send typewriter character values (left legend). (Default)
DECNKM ² (Keypad application)	CSI ? 66 h	Set: Numeric keypad keys send application sequences (see Appendix D).
	CSI ? 66 l	Reset: Numeric keypad keys send characters shown on keycap. (Default)
DECNRCM ⁴ (National replacement character)	CSI ? 42 h	Set: National mode on. Sends and receives 7-bit characters and translates them into the appropriate National Replacement Character (NRC) based on the keyboard language chosen.
	CSI ? 42 l	Reset: National mode off. Displays 8-bit characters from the current GR set. (Default)
KAM (Keyboard lock)	CSI 2 h	Set: Locks the keyboard except for the Break and Setup keys. Displays WAIT on the status line.
	CSI 2 l	Reset: Unlocks the keyboard. (Default)
Paging Functions		
DECHCCM ² (Horizontal panning)	CSI ? 60 h	Set: Display adjusts to keep the cursor visible when it moves past the left or right margin. (Horizontal windowing must be turned on in setup mode.) (Default)
	CSI ? 60 l	Reset: Cursor disappears when it moves past the left or right margin of the display.
DECPCCM ² (Page coupling)	CSI ? 64 h	Set: When the cursor moves to another page, that page is displayed. (Default)
	CSI ? 64 l	Reset: The page where the cursor is addressed is not displayed. Current page continues to be displayed.
DECVCCM ² (Vertical panning)	CSI ? 61 h	Set: When the cursor moves past the top or bottom line, the display adjusts to keep the cursor in view. (Default)
	CSI ? 61 l	Reset: Cursor disappears when it moves past the top or bottom line of the display.

4. Command is ignored if keyboard language is set to U.S.

Table 2-2 Set/Reset Functional Modes, Continued

Mnemonic	Command Sequence	Function
Cursor Control Functions		
DECTCEM (Text cursor enable)	CSI ? 25 h	Set: Displays the cursor. (Default)
	CSI ? 25 l	Reset: Does not display the cursor.
WYSTCURM (Steady cursor)	CSI 33 h	Set: Displays a steady cursor.
	CSI 33 l	Reset: Displays a blinking cursor. (Default)
WYULCURM (Underline cursor)	CSI 34 h	Set: Displays an underline cursor.
	CSI 34 l	Reset: Displays a block cursor. (Default)
Sending and Printing Functions		
DECEDM (Block mode)	CSI ? 10 h	Set: Turn on block mode.
	CSI ? 10 l	Reset: Turns off block mode; puts terminal in full-duplex mode. (Default)
DECPEX (Print extent)	CSI ? 19 h	Set: Prints full page. (Default)
	CSI ? 19 l	Reset: Prints scrolling region.
DECPFF (Print form feed)	CSI ? 18 h	Set: Transmits the FF (form feed) print termination character to the printer after a print page operation.
	CSI ? 18 l	Reset: Does not transmit a print termination character to the printer after a print page operation. (Default)
SRM (Local echo disable)	CSI 12 h	Set: Local echo off (full-duplex mode). Characters sent from the terminal to the host are not displayed on the screen. The host must return any characters for display to the terminal. (Default)
	CSI 12 l	Reset: Local echo on (half-duplex mode). Characters sent from the terminal to the host are simultaneously displayed on the screen.
TTM (Transfer termination)	CSI 16 h	Set: Transmits data through the cursor position in the requested transmission area. (Default)
	CSI 16 l	Reset: Transmits data from the entire requested area, regardless of the cursor position.

Table 2-2 Set/Reset Functional Modes, Continued

Mnemonic	Command Sequence	Function
Sending and Printing Functions, Continued		
WYGATM (Nonerasable area transmit)	CSI 37 h	Set: Sends all characters, including nonerasable characters. (Default)
	CSI 37 l	Reset: Sends erasable characters only.
WYTEXM (Send full page)	CSI 38 h	Set: Sends full page. (Default)
	CSI 38 h	Reset: Sends scrolling region.
Processing and Control Functions		
CRM (Monitor)	CSI 3 h	Set: Controls mode on. Displays symbolic representations of control characters.
	CSI 3 l	Reset: Controls mode off. Does not display control characters, but interprets them as actions to be executed. (Default)
DECANM (ANSI/VT52)		No set function. (To exit VT52 personality, see VT52 command, Table F-2.)
	CSI ? 2 l	Reset: Selects VT52 personality.
FEAM (Control execution disable)	CSI 13 h	Set: Inhibits execution of all control and escape sequences except ESC c (hard terminal reset) and CSI 13 l (control execution disable reset); executes LF (linefeed), FF (form feed), or VT (vertical tab) as CRLF (carriage return, linefeed).
	CSI 13 l	Reset: Executes all control and escape sequences. (Default)
WYASCI (Wyse 350)	CSI 42 h	Set: Selects Wyse 350 personality.
		Reset: No reset function
WYTEK (TEK 4010/4014)	CSI ? 38 h	Set: Selects TEK 4010/4014 personality. Command is ignored if the terminal is set up for two sessions.
		Reset: No reset function.

SELECTING TERMINAL PERSONALITIES

DECSC	Select native personality	CSI 90 ; Ps " p
where	<i>Ps</i> Bit Transmission	
	0 8-bit	
	1 7-bit	
DECSC	Select VT320/VT220 personality	CSI 63 ; Ps " p or CSI 62 ; Ps " p
where	<i>Ps</i> Bit Transmission	
	1 7-bit	
	2 8-bit	
DECSC	Select Intecolor 220 personality	CSI 91 " p
DECSC	Select VT100 personality	CSI 61 " p
DECSC	Select ADDS A2 personality	CSI 93 " p

- Note** Wyse 350 and VT52 personalities are selected by functional mode commands (see WYASCII and DECANM, Table 2-2).

The following commands apply only to the native and VT320/VT220 personalities.

S7C1T	Select 7-bit transmission mode	ESC SPACE F
	This command sequence causes the terminal to send all C1 control characters as 7-bit escape sequences. Execution of the command changes the terminal's personality as follows:	
	Personality Before	Personality After
	Native personality, 8-bit	Native personality, 7-bit
	Native personality, 7-bit	Same (sequence ignored)
	VT320/VT220 personality, 8-bit	VT320/VT220 personality, 7-bit
	VT320/VT220 personality, 7-bit	Same (sequence ignored)
S8C1T	Select 8-bit transmission mode	ESC SPACE G

This command sequence causes the terminal to send C1 control characters to the host as single 8-bit characters. Execution of the command changes the terminal's personality as follows:

Personality Before	Personality After
Native personality, 8-bit	Same (sequence ignored)
Native personality, 7-bit	Native personality, 8-bit
VT320/VT220 personality, 8-bit	Same (sequence ignored)
VT320/VT220 personality, 7-bit	VT320/VT220 personality, 8-bit

SETTING THE DATE AND TIME

WYDTSET **Set date and time** **CSI 58 ; Ps ; Ps1 ; Ps2 ; Ps3 ; Ps4 w**

where *Ps* is the day (1-31)
Ps1 is the month (1-12)
Ps2 is the year (0-99)
Ps3 is the hour (1-24)
Ps4 is the minute (0-59)

In the native personality only, this command sets the date and time that displays on the *system status line*. The date and time must be reset at each power-on.

The date alone can be set by including only the *Ps*, *Ps1*, and *Ps2* parameters in the command. The time alone can be set by omitting those three parameters, e.g.,

CSI 58 ; ; ; ; Ps3 ; Ps4 w

CONTROLLING TERMINAL PROCESSING

DECSC
WYSC

The commands described in this section control terminal processing and abort escape sequences.

Save cursor position

ESC 7
or CSI s

This command saves the following in the terminal's memory:

- Cursor position
- Character attributes set by the SGR command
- Character sets (G0, G1, G2, or G3) currently in GL and GR
- Wrap flag (autowrap/no autowrap)
- State of origin mode (DECOM)
- Selective erase attribute

DECRC
WYRC

Restore cursor position

ESC 8
or CSI u

This command restores the terminal to the state saved by the DECSC or WYSC command. If nothing was saved, the command

- Moves the cursor to the home position (upper left of screen)
- Resets origin mode (DECOM)
- Resets character attributes to normal
- Assigns the ASCII character set to GL and the Multinational Supplemental character set to GR

WYDELAY	Delay terminal processing	ESC ,
	This escape sequence stops terminal processing for approximately 250 milliseconds.	
BEL	Sound bell	CTRL G
	This control sequence sounds the terminal bell unless the bell has been disabled in setup mode (Warning Bell parameter).	
CAN	Abort escape sequence	CTRL X
	This control sequence aborts the current escape sequence operation.	
SUB	Abort escape sequence	CTRL Z
	This control sequence aborts the current escape sequence operation and displays a reverse question mark (?) in the native, VT320/VT220, and Intecolor personalities or a checkerboard character (⌘) in VT100 or VT52 personalities.	
OSC PM APC	Ignore subsequent data	ESC] or ESC ^ or ESC _
	These control sequences cause the terminal to ignore all subsequent data received until a string terminator (ST) is received.	

RESETTING THE TERMINAL

	The DECSTR and RIS commands reset many of the terminal's control functions (native and VT320/VT220 personalities only).
DECSTR	Soft terminal reset CSI ! p
	This command sequence issues a soft terminal reset, which
	<ul style="list-style-type: none"> • Turns on the cursor (if off) • Resets insert mode (IRM) • Resets origin mode (DECOM) • Sets autowrap mode (DECAWM) to value last saved in nonvolatile memory • Resets keyboard lock mode (KAM) • Resets keypad application mode (DECNKM) • Resets cursor key application mode (DECCKM) • Clears scrolling region (DECSTBM)

- Resets G0, G1, G2, G3, GL, and GR to their default selections
- Resets character attributes to normal
- Resets erase attribute to erasable
- Resets save cursor state to default
- Resets national mode (7-bit) to multinational mode (8-bit) (DECNRCM)
- Resets user-preferred character set to value last saved in nonvolatile memory (Character Set setup parameter) (DECAUPSS)
- Sets data destination to screen data area (DECSASD)

RIS**Hard terminal reset****ESC c**

This escape sequence issues a hard terminal reset, which

- Turns on the cursor (if off)
- Resets insert mode (IRM)
- Resets origin mode (DECOM)
- Sets autowrap mode (DECAWM) to the value last saved in nonvolatile memory
- Resets keyboard lock mode (KAM)
- Resets keypad application mode (DECNKM)
- Resets cursor key application mode (DECKKM)
- Clears scrolling region (DECSTBM)
- Resets G0, G1, G2, G3, GL, and GR to their default selections
- Resets character attributes to normal
- Resets erase attribute to erasable
- Resets save cursor state to default
- Resets national mode (7-bit) to multinational mode (8-bit) (DECNRCM)
- Resets user-preferred character set to value last saved in setup mode (Character Set parameter) (DECAUPSS)
- Sets data destination to screen data area (DECSASD)
- Performs communication line disconnect and reconnect
- Restores all setup mode operating parameters, tab stops, answerback message, and function key definitions to values last saved in nonvolatile memory

- Clears softfonts
- Clears screen
- Homes cursor
- Clears screen hold (no scroll)
- Turns on display (if off)
- Clears CAPS LOCK mode
- Clears the XOFF receive state on the host port
- Clears the XOFF receive state on the printer port
- Clears the handshake state, raises DTR if low, and sends XON if XON/XOFF handshaking is enabled

WYSTR**Terminal mode reset****ESC ! p**

This escape sequence issues a terminal mode reset, which

- Turns on display (if off)
- Clears block mode (sets to on-line mode)
- Resets insert mode (IRM)
- Clears function key lock
- Resets cursor key application mode (DECCKM)
- Resets keyboard lock mode (KAM)
- Resets keypad application mode (DECNKM)
- Clears the XOFF receive state on the host port
- Clears the XOFF receive state on the printer port
- Resets G0, G1, G2, G3, GL, and GR to their default selections
- Clears the handshake state, raises DTR if low, and sends XON if XON/XOFF handshaking is enabled

TESTING THE TERMINAL
DECALN**Display screen adjustment pattern****ESC # 8**

This escape sequence fills the screen with uppercase E's. You can use the adjustment pattern to align the screen display.

3

Controlling the Keyboard

INTRODUCTION

This chapter discusses user-defined key programming and numeric keypad application mode. Refer to Appendix C for local keyboard commands and to Appendix D for key codes.

PROGRAMMING THE USER-DEFINED KEYS

The general syntax for the user-defined key programming device control string is

**WYUDK
(DECUDK)**

Program user-defined keys **DCS *Ps* ; *Ps1* ; *Ps2* | *kc* / *hc* ST**

where **DCS** is the 8-bit device control character (or the 7-bit escape sequence ESC P).

Ps indicates whether or not to clear existing key definitions before accepting new definitions.

Ps **Clear**

0 Clear all key definitions before loading new definitions (default).

1 Clear key definitions only as they are redefined. When ***Ps*** is 1, you can redefine some keys while preserving the current definitions of others.

Ps1 indicates whether or not to lock the key definitions against further changes after they're redefined.

Ps1 **Key Lock**

0 Lock key definitions. If you want to load new values into the keys, you must unlock the keys in setup mode (User-Defined Keys parameter). If a key is locked and an application tries to redefine the key with a DECUDK sequence, the terminal ignores the sequence.

1 Do not lock key definitions. The keys can be redefined with another DECUDK string.

Ps2 defines the key's direction: remote, local, or normal. When the direction is *remote*, key definitions are sent to the host. When the direction is *local*, definitions are sent only to the terminal. When

the direction is *normal*, key definitions are sent according to the terminal's current communications mode.

Ps2	Direction
0	Remote (default)
1	Normal
2	Local

| identifies this control string as a DECUDK.

kc specifies the key being defined (see Table 3-1).

hc is a string of 2-digit hexadecimal codes (each digit in the 0-9 or A-F range) representing the ASCII values of the character string to be loaded into the key.

ST is the string terminator. ST is a C1 8-bit control character (use ESC \ in a 7-bit environment)

Table 3-1 Key Codes

kc	Code		Keyboard Style		
	Unshifted	kc Shifted	105-Key ANSI	ASCII	Enhanced PC
42		22		F1	F1
51		31		F2	F2
52		32		F3	F3
53		33		F4	F4
54		34		F5	F5
37		17	F6	F6	F6
38		18	F7	F7	F7
39		19	F8	F8	F8
40		20	F9	F9	F9
41		21	F10	F10	F10
43		23	F11	F11	F11
44		24	F12	F12	F12
45		25	F13	F13	
46		26	F14	F14	
48		28	Help	F15	
49		29	Do	F16	
51		31	F17		
52		32	F18		
53		33	F19		
54		34	F20		

Table 3-1 Key Codes,
Continued

kc	Code		Keyboard Style		Enhanced PC
	Unshifted	kc Shifted	105-Key ANSI	ASCII	
50		27		Esc	Esc
55		01	Tab	Tab	Tab
56		02	⌫	Back Space	Back Space
57		03	Remove	Del	
58		04	Return	Return	Enter
47		05		Home	Home
59		06	▲	▲	↑
60		07	▼	▼	↓
61		08	◀	◀	←
62		09	▶	▶	→
63		10	Enter	Enter	Enter <i>cpd</i>
64		11	PF4	Ins Char	Insert
65		12	Next Scrn	Next Page	Page Down
66		13		Send	
67		14	PF3	Clr Line	
68		15	PF2	Del Char	Delete
69		16	PF1	Repl	
70		05	Insert Here		
71		13	Prev Scrn		
72		22	Find		
73		27	Select		
74		13			End
75		14			Page Up
76		03			Print Screen

You can specify multiple *kc/hc* parameters by separating them with semicolons (;).

A maximum of 512 bytes can be used for function key definitions, with a maximum of 78 bytes for any single function key.

Examples of DECUDK Device Control Strings

The sequence

```
DCS 0 ; 1 | ST
```

clears all user-defined key definitions.

The sequence

DCS 1 ; 0 | ST

locks the current user-defined key definitions.

The sequence

DCS1;1|18/4C4F47494E2048454C454E0D;38/4C4F474F55540DST

- Clears only keys being redefined
- Does not lock the new key definitions
- Loads the code for LOGIN HELEN CR into Shift F7
- Loads the code for LOGOUT CR into F7

Until the keys are redefined, pressing Shift F7 is the same as entering LOGIN HELEN, followed by a carriage return, and pressing F7 is the same as entering LOGOUT, followed by a carriage return.

NUMERIC KEYPAD FUNCTIONS

The numeric keypad operates in two modes: application mode or numeric mode. These modes are selectable in setup mode (Numeric Keypad setup parameter) or with an escape sequence. In either mode, numeric keypad keys generate predefined codes.

Selecting Numeric Keypad Modes

DECKPAM	Select numeric keypad application mode	ESC =
DECKPNM	Select numeric keypad numeric mode	ESC >

In numeric mode the keys send the standard ASCII character codes represented on the keycaps. Table D-5 in Appendix D lists the application mode codes.

- Note** The PF keys (Table D-4) send the same codes in both numeric and application mode.

RELATED FUNCTIONAL MODE COMMANDS

DECARM	Key autorepeat mode	Set: CSI ? 8 h Reset: CSI ? 8 l
DECBKM	Delete key redefinition mode	Set: CSI ? 67 h Reset: CSI ? 67 l
DECCKM	Cursor key application mode	Set: CSI ? 1 h Reset: CSI ? 1 l
DECKBUM	Key legend mode	Set: CSI ? 68 h Reset: CSI ? 68 l
DECNKM	Keypad application mode	Set: CSI ? 66 h Reset: CSI ? 66 l
DECNRCM	National replacement character mode	Set: CSI ? 42 h Reset: CSI ? 42 l
KAM	Keyboard lock mode	Set: CSI 2 h Reset: CSI 2 l
LNМ	Newline mode	Set: CSI 20 h Reset: CSI 20 l
WYDELKM	Delete key redefinition mode	Set: CSI 36 h Reset: CSI 36 l

4

Defining and Displaying Character Sets

INTRODUCTION

This chapter describes the terminal's predefined character sets and explains how to define and load softfont characters.

Predefined character sets are illustrated in Appendix A.

DISPLAYING CHARACTER SETS

The character displayed on the screen depends on four variables:

- The currently *labeled* character set
- The currently *assigned* font bank
- The screen *resolution* (character cell size)
- The ASCII code of the character

The default screen resolution is 16x16 (74 Hz). The user can select a 16x20 screen resolution (60 Hz) from setup mode.

- Note** At 74 Hz the screen is refreshed at a higher rate than at 60 Hz, eliminating screen flicker.

Two different character sets can be loaded into display memory at one time. The two sections of memory reserved for these character sets are referred to as *GL* (graphic left) and *GR* (graphic right). The GL memory area corresponds to the 7-bit ASCII character codes 21H through 7EH for character sets having 94 characters and 20H through 7FH for character sets having 96 characters. The GR memory area corresponds to the 8-bit ASCII character codes A1H through FEH for 94-character sets and A0H through FFH for 96-character sets.

You can select character sets for display by *labeling* character sets and *assigning* font banks in a two-step process, using separate escape sequences:

- 1 One escape sequence labels a specified character set as one of four font banks: G0, G1, G2, or G3.
- 2 Another escape sequence assigns the font bank to the GL or GR memory area.

Figure 4-1 shows a conceptual diagram for labeling character sets and assigning font banks into GL and GR.

Figure 4-1 Labeling Character Sets and Assigning Font Banks

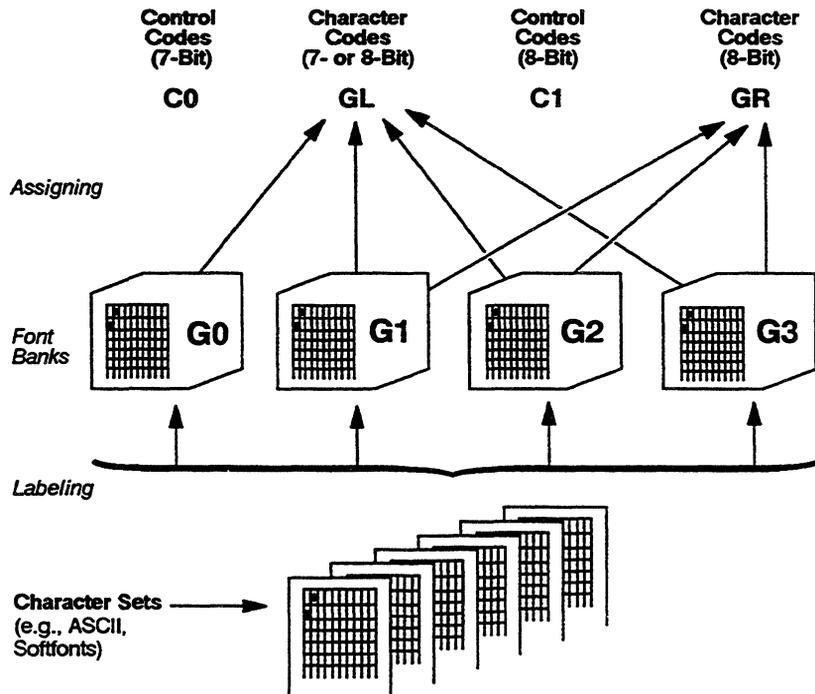

Table 4-1 lists the default predefined character sets in each personality.

Table 4-1 Default Character Sets

Personality	Default Character Set	Labeled	Assigned
Wyse 370	ASCII User-Preferred Supplemental*	G0, G1 G2, G3	G0 to GL G2 to GR
VT320/VT220 and Intecolor	ASCII User-Preferred Supplemental*	G0, G1 G2, G3	G0 to GL G2 to GR
VT100	ASCII	G0, G1	G0 to GL
VT52	ASCII	N/A	N/A

* Default is Multinational Supplemental

Selecting a User-Preferred Supplemental Character Set

In the native or VT320/VT220 personality you can select either the Multinational Supplemental (default) character set or the ISO Latin-1 character set as your 8-bit *user-preferred supplemental* character set.

DECAUPSS	Select Multinational Supplemental as the user-preferred supplemental set	DCS 0 ! u % 5 ST
DECAUPSS	Select ISO Latin-1 Supplemental as the user-preferred supplemental set	DCS 1 ! u A ST

Labeling Character Sets

The SCS escape sequence labels a specified character set as one of four font banks.

SCS	Label character set	ESC <i>fcode</i> <i>scode</i>
------------	----------------------------	--------------------------------------

where *fcode* indicates the font bank (G0, G1, G2, or G3).

<i>fcode</i>	Font Bank
(G0 (94-character set)
)	G1 (94-character set)
*	G2 (94-character set)
+	G3 (94-character set)
-	G1 (96-character set; native and VT320/VT220 only)
.	G2 (96-character set; native and VT320/VT220 only)
/	G3 (96-character set; native and VT320/VT220 only)

scode identifies the character set to be loaded in the font bank. Parameter values are listed in two groups. The second group is valid only when national replacement character set mode is set (DECNRCM) and when the language has been selected in setup mode (Keyboard Language setup parameter). Only one national replacement character (NRC) set is available at a time.

<i>scode</i>	Character Set
0	Special Graphics
A	ISO Latin-1 Supplemental (96-character set; native and VT320/VT220 only)
B	ASCII
<	User-preferred supplemental In native or VT320/VT220 personality, either the Multinational Supplemental or the ISO Latin-1 set, depending on the current selection in setup mode or by the DECAUPSS command
% 5	Multinational Supplemental (native and VT320/VT220 only)
name	Softfont name assigned by the <i>name</i> parameter in the softfont load command (DECDDL)

<i>scode</i>	NRC Character Set
A	UK
4	Dutch
C or 5	Finnish
R	French/Belgian
Q or 9	French Canadian
K	German
Y	Italian
X	Latin American Spanish
E or 6 or '	Norwegian/Danish
% 6	Portuguese
Z	Spanish
H or 7	Swedish
=	Swiss

- Note** The ISO Latin-1 supplemental character set is the only predefined character set with 96 characters. All other predefined character sets have 94 characters. A 96-character set cannot be labeled G0.

Assigning Font Banks

Once a character set is labeled, you can assign it to the GL or GR memory area with one of the following escape or control sequences:

SI or LS1	Assign G0 character set to GL	CTRL O
SO or LS0	Assign G1 character set to GL	CTRL N
LS1R	Assign G1 character set to GR	ESC ~
LS2	Assign G2 character set to GL	ESC n
LS2R	Assign G2 character set to GR	ESC }
LS3	Assign G3 character set to GL	ESC o
LS3R	Assign G3 character set to GR	ESC
SS2	Assign G2 character set to GL for the next character only	ESC N
SS3	Assign G3 character set to GL for the next character only	ESC O

Examples

Suppose you want to gain access to the special line-drawing characters in the 94-character Special Graphics character set (see Appendix A). To display the Special Graphics character set for ASCII codes 21H through 7EH (GL memory area),

- 1 Label the Special Graphics set as G1 **ESC) O**
- 2 Assign G1 to GL **CTRL N**
- 3 Send characters (7 bit)

To display the 96-character ISO Latin-1 Supplemental character set for ASCII codes A0H through FFH (GR memory area),

- 1 Label the ISO Latin-1 set as G3 **ESC / A**
- 2 Assign G3 to GR **ESC |**
- 3 Send characters (8 bit)

CREATING AND LOADING SOFTFONTS

The terminal stores user-definable character sets in a font bank called a *softfont*. Initially, all character positions in the softfont are displayed as reverse question marks (?).

- Note** Softfonts are not supported in VT52 or VT100 personalities.

Overview

The display of softfonts depends on the screen resolution selected and the number of columns displayed. No softfonts are available in 16x20 (60 Hz) resolution when the screen size is 80 columns and 24

lines. In the default 16x16 (74 Hz) resolution, the 80-column softfonts are not interchangeable with those for a 132- or 161-column screen.

Screen Resolution

In 16x16 (74 Hz) screen resolution, you can design softfonts for an 80-column screen and for a 132-column or 161-column screen. An 80-column screen requires its own softfont; the softfont loaded for an 80-column screen cannot be displayed on a screen which has been defined as 132 or 161 columns. However, a softfont designed for a 132-column screen can be displayed on a 161-column screen. The terminal automatically switches to the correct softfont when the column width is changed.

Creating the Softfont

To create your own softfont,

- 1 Design the individual characters, as described in the next section, and encode their description in ASCII format so the terminal can recognize them.
- 2 Load the characters into the softfont with the DECDLD device control sequence, as described in the subsequent section called "Loading a Softfont."

Designing and Encoding the Softfont Character

Characters displayed on the screen are patterns of illuminated and nonilluminated *pixels* (picture elements). A pixel is the smallest unit of the display that can be turned on (illuminated) or off. Each character is designed to fit into a block of pixels called a *character cell*. The area of the cell that contains the pattern of the character is called the *character matrix*.

Designing a softfont character and encoding it for the terminal consists of the following steps:

- 1 Determine the character cell size.
- 2 Determine the character matrix size.
- 3 Diagram the character on a grid representing the pixels in the character cell.
- 4 Mark the grid with 1's and 0's, assigning a value of 1 to the "on" pixels and a value of 0 to the "off" pixels to represent the bit pattern of the character.
- 5 Convert the bit pattern of each vertical column of the grid to a binary number in groups of six pixels called *sixels*.

- 6 Convert the binary number for each sixel to an ASCII character equivalent.
- 7 List the ASCII characters in a string that completely describes the character to be loaded into the softfont.

Determining the Character Cell Size

Table 4-2 shows the character cell size for each configuration of screen lines and columns.

Table 4-2 Cell Sizes

Lines	Screen Size		Cell Size (Pixels)	
	Columns		Width	Height
26	80		16	16
	132		10	16
	161		8	16
52	80		16	8
	132		10	8
	161		8	8

Determining the Character Matrix Size

The size of the actual character matrix varies according to the cell size and the type of character you are designing (text or line-drawing). Table 4-3 lists maximum character matrix dimensions.

Table 4-3 Maximum Matrix Sizes

Lines	Screen Size		Character Matrix Width		Character Matrix Height
	Columns	Cell Size	Text ¹	Line-Drawing ²	
26	80	16x16	12	16	16
	132	10x16	7	10	16
	161	8x16	7	8	16
52	80	16x8	12	16	8
	132	10x8	7	10	8
	161	8x8	7	8	8

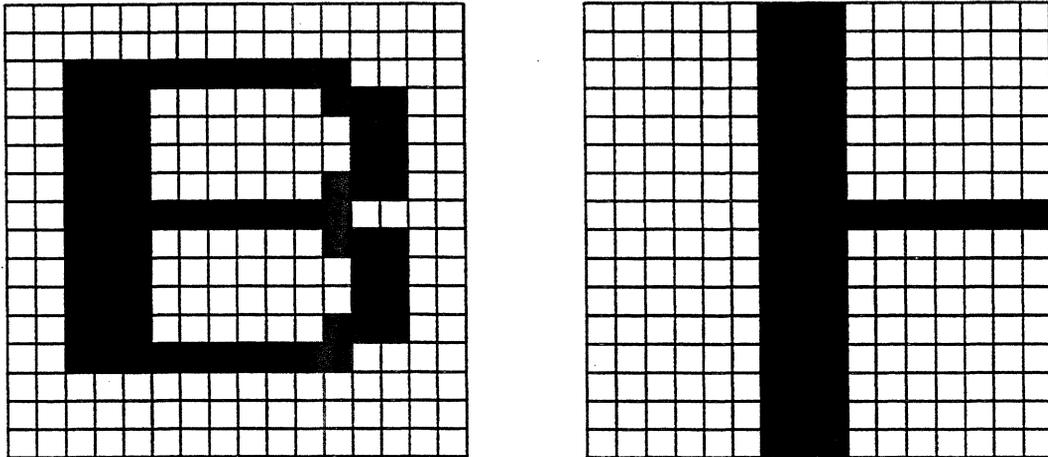

1. When *text cell* is selected in DECDLD command.

2. When *full cell* is selected in DECDLD command.

You specify the size of the character matrix with the values you send for the parameters *Ps3* (*character matrix width*) and *Ps6* (*character matrix height*) in the DECDLD device control string that loads the character.

Figure 4-2 shows the character matrix for a typical text character (uppercase B) and a typical line-drawing character in a 16x16 cell.

Figure 4-2 Typical Character Matrixes (16x16 Cell)

In deciding the width and height of the character matrix, you must take into account a basic difference between text and line-drawing characters. A line-drawing character typically extends to the outside edge of the cell so adjoining line-drawing characters can touch it in order to draw a graphic shape. But text characters require spacing between each character, so part of each cell must be left empty to create that space.

The terminal automatically allows for some spacing between text characters unless you specify a “full cell” for the font type parameter *Ps5* in the DECDLD device control sequence. (If you specify a full cell, the character matrix can be as wide as the character cell itself.) The number and position of cell columns which are left blank for text characters are listed in Table 4-4.

Table 4-4 Maximum Width of Text Characters

Screen Columns	Total Cell Width	Blank Cell Columns*	Maximum Character Width
80	16 pixels	1, 2, 15, 16	12
132	10	1, 9, 10	7
161	8	1	7

* By column number, starting at the left side of the cell

Diagramming a Character

To diagram a character,

- 1 Draw a grid to represent each pixel in the character cell and map the "on" pixels that define the pattern of the character.
- 2 Draw a duplicate blank grid and translate the pattern from the first grid into the blank grid by marking 1's for each "on" pixel and 0's for each "off" pixel.

Figure 4-3 shows the bit pattern for the uppercase text character B illustrated in Figure 4-2.

Figure 4-3 Bit Pattern of Uppercase Text Character B

		0	0	0	0	0	0	0	0	0	0	0	0		
		0	0	0	0	0	0	0	0	0	0	0	0		
		1	1	1	1	1	1	1	1	1	0	0			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	1	1	1	1	1	1	0	0			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	0	0	0	0	0	0	1	1			
		1	1	1	1	1	1	1	1	1	0	0			
		0	0	0	0	0	0	0	0	0	0	0			
		0	0	0	0	0	0	0	0	0	0	0			
		0	0	0	0	0	0	0	0	0	0	0			

Sectioning the Grid into Sixels

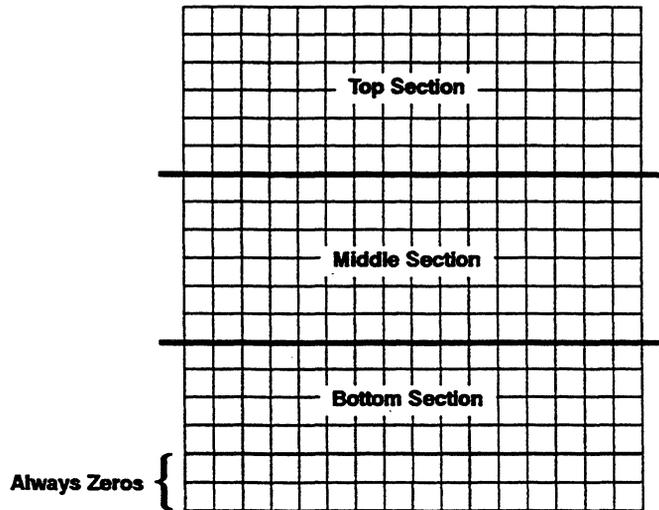

After you have marked the second grid with each pixel's bit value, divide each column of the grid into three groups of six pixels, called a *sixel*.

Figure 4-4 shows the sixel sections of a 16x16 character cell.

You must add two lines of zero pixels to fill out the bottom sixel section.

- Note** If the cell is only eight lines high, you will have only two sixel sections; you will need to add four lines of zero pixels to fill out the bottom sixel section.

Figure 4-4 Sixel Sections

Converting the Sixels to ASCII Equivalents

You encode the character for the terminal by converting the bit pattern of each sixel to an ASCII character equivalent. The ASCII characters are entered as a string of sixel bit pattern (*Sxbp*) values in the DECDLD device control sequence that loads the character.

To determine the ASCII characters required to represent the character you have designed,

- 1 Convert the bit pattern of each sixel in the top section to a binary number, starting with the leftmost column and continuing across the cell. The most significant bit is at the bottom of the sixel,

- 3 Convert the binary numbers derived in steps 1 and 2 to ASCII character equivalents for each column of sixels. Refer to Table 4-5 for these equivalents. (The table is not a standard ASCII code conversion table.)

Table 4-6 shows the values for the example character B.

**Table 4-5 Conversion Table
(Bit Pattern Values to ASCII
Characters)**

Bit Pattern	Decimal	ASCII	Bit Pattern	Decimal	ASCII
000000	063	?	100000	095	-

Bottom	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000001	064	@
	000000	063	?
	000000	063	?

4 You will first enter the ASCII characters that represent the top sixels, followed by the characters for the middle and bottom sixel sections. Enter the characters from left to right, and separate the characters for each sixel section (top, middle, and bottom) with a slash (/).

The resulting *Sx*bp string that describes the example character B is

```

{{{CCCCCKww/~ ~ ~ AAAAAAf|!|/@@@@@@@@@@@
??
    
```

Loading a Softfont

DECDDL

Load softfont

```

DCS Ps ; Ps1 ; Ps2 ; Ps3 ;
  Ps4 ; Ps5 ; Ps6 ; Ps7 {
  name Sxbp ; ... ; Sxbp ST
    
```

where *Ps* is the font number, which can be a value of either 0 or 1.

Ps1 is a decimal number identifying the position in the character set where the first character will be loaded. Character positions are numbered consecutively. Note that positions 20H and 7FH are not available for a 94-character set.

<i>Ps1</i>	Initial Character Position
0	21H (decimal 33) for a 94-character set 20H (decimal 32) for a 96-character set
1-94	21H (decimal 33) through 7EH (decimal 126)
95	7FH (decimal 127) for a 96-character set only

For example, if you wanted the first character in your softfont to be in the same position as the asterisk (*) in the ASCII character set (shown in Appendix A), you would enter a *Ps1* value of 10. If you were to load a total of 20 characters in sequence, the last character would be loaded in the position occupied by the equal sign (=) in the ASCII set.

Ps2 controls the erasing of characters in the softfont

<i>Ps2</i>	Erase Control
0	Erase all characters in the softfont before loading new characters (default)
1	Erase only the character(s) being replaced
2	Erase all characters in both the 80-column and 132-/161-column softfont rendition

Ps3 is the character matrix width:

- The value selected overrides the sixel pattern specified. For example, if *Ps3* = 8, only the first eight sixel values are recognized.
- Select values 2 or 3 only to load characters previously designed for a 10x10 character cell (DEC VT220-compatible). The terminal will automatically adjust the pattern of the character to fit the current cell dimensions.

<i>Ps3</i>	Character Matrix Width
0	16 pixels in 80-column display (default) 10 pixels in 132-column display (default) 8 pixels in 161-column display (default)
1	Illegal
2	5 pixels wide
3	6 pixels wide
4	7 pixels wide
5	5 pixels wide
6	6 pixels wide
7	7 pixels wide
8	8 pixels wide
9	9 pixels wide
10	10 pixels wide
11	11 pixels wide
12	12 pixels wide
13	13 pixels wide
14	14 pixels wide
15	15 pixels wide
16	16 pixels wide

Ps4 is the font width

<i>Ps4</i>	Font Width
0 or 1	80-column display (default)
2	132- or 161-column display

Ps5 is the font type. If a full cell is selected, all pixels in the cell can be individually addressed. If a text cell is selected, the terminal automatically provides character spacing by blanking some columns of the cell.

<i>Ps5</i>	Font Type
0 or 1	Text cell (default)
2	Full cell

Ps6 is the character matrix height

<i>Ps6</i>	Character Matrix Height
0	16 pixels (default)
1-16	Values correspond to the number of pixels (e.g., 4 = four pixels high)

Ps7 is the character set size (native and VT320/VT220 personalities only)

<i>Ps7</i>	Character Set Size
0	94-character set (default)
1	96-character set

{ is a separator

name is a one-, two-, or three-character name assigned to the softfont character set and referenced when labeling the set (SCS):

First character (optional) = ASCII character from SP to / (20H - 2FH)

Second character (optional) = ASCII character from SP to / (20H - 2FH)

Third character (required) = ASCII character from 0 to ~ (30H - 7EH)

Sxhp is the sixel bit pattern defining the character being loaded. Up to 94 or 96 individual character bit patterns, separated by semicolons (;) may be specified, depending on the character set size (*Ps7* parameter).

ST is the string terminator

- Note** Parameters *Ps1* through *Ps7* must be separated by semicolons (;).

The sequence

```
DCS 0 ; 13 ; 1 ; 12 ; 0 ; 0 ; 11 ; 0 { # B
  {{{CCCCCKww/~ ~ ~ AAAAAAf|!|/@@@@@@@@@@
  ?? ST
```

loads the example uppercase B text character

- In position 2DH (decimal 45)
- Without erasing the existing characters in any other positions in the softfont
- For an 80-column display
- In a 94-character set named # B

Displaying the Softfont Characters

To display characters from the softfont, you must label the softfont character set (SCS) and assign it to the GL or GR memory area as described in the section on “Predefined Character Sets.”

- Note** A 96-character set cannot be labeled G0.

THE WYLSFNT SOFTFONT LOAD COMMAND

The DECDLD command described in the previous section loads softfonts only in the DEC-compatible softfont areas of the terminal’s font banks 2 and 3, where no predefined characters reside. With the command described in this section you can load

softfonts into any position in any of the font banks, allowing you to change or replace the terminal's predefined characters.

- **Caution** Once changed, the terminal's predefined characters can only be restored at power-on or by a hard terminal reset.

These font banks are the default hardware-based storage locations for the characters displayed by the terminal. There are four font banks, each having 128 character positions. In 16x16 (74 Hz) resolution, the characters in all four font banks are available for display. However, when the screen is set for 80 columns and 26 lines in 16x20 (60 Hz) resolution, only the 256 characters in font banks 0 and 1 are available for display.

WYLSFNT

Load softfont

DCS 0 ; Ps ; Pn } ds...ds ST

where *Ps* is the font bank in which the softfont character is to be loaded (Figure 4-6)

Ps Font Bank

0 0

1 1

2 2 (not available in 16x20 resolution, 80x26 screen size)

3 3 (not available in 16x20 resolution, 80x26 screen size)

Pn is a decimal number from 0 through 127 identifying the character's position in the font bank (Figure 4-6)

} is a separator

ds...ds is a data string defining the character

ST is the string terminator

Figure 4-6 shows the terminal's font banks.

Figure 4-6 Font Banks

Font Bank 3

To find the value of P_n , read across the top line of the font bank illustration and count down. For example, the decimal value of the uppercase text character W in font bank 0 is 87.

- Note** If you want to load your softfont character in the “empty” softfont positions in font banks 2 or 3, you must select font bank 2 for an 80-column softfont and font bank 3 for a 132-/161-column

softfont. If you load softfonts over predefined characters, those characters on the screen will change immediately.

To display characters from the softfont, label and assign the character sets with the commands described in the section on “Displaying Character Sets.”

Designing the Softfont Character

The steps in designing the softfont character are identical to the steps described for the DECDLD command in the previous section:

- 1 Determine the character cell size.
- 2 Determine the character matrix size.
- 3 Diagram the character on a grid representing the pixels in the character cell.
- 4 Assign a value of 1 to the “on” pixels and a value of 0 to the “off” pixels to represent the bit pattern of the character.

Refer to Table 4-2 earlier in this chapter for the character cell sizes for the various screen configurations. Refer to Table 4-3 for guidelines on determining the character matrix size; Figure 4-2 shows typical text and line-drawing characters in the default 16x16 character cell size.

- Note** Unlike the DECDLD command, this command has no provision for automatically allowing for space between text characters. You must diagram the character to have the appropriate number of “off” pixels at each side of the cell, as well as at the top and bottom, to allow for spacing between text characters.

Encoding the Softfont Character

The way in which the softfont character is encoded into a data string that defines it for the terminal is completely different from the way the character is encoded for loading by the DECDLD command. Instead of encoding the bit pattern of the vertical columns, you encode the bit pattern of each horizontal line:

- 1 After you have assigned 1’s and 0’s to the pixels in the character cell, divide each line of the cell into groups of four bits (*nibbles*).
- 2 Record the binary value of each nibble in the line, starting at the left side of the top line of the cell.
- 3 Convert the binary values into ASCII character equivalents.
- 4 Combine the ASCII characters into a character string (*ds*) that defines the bit pattern of the character.

Figure 4-7 illustrates the same uppercase B text character in a 16x16 character cell that was used as an example in the previous section. The figure shows the bit pattern divided into nibbles and the conversion of the binary nibble values into ASCII characters. The shaded areas show selected binary nibble values matched with their corresponding ASCII values.

Figure 4-7 Converting the Nibbles to ASCII Values

1 Byte (8 Bits)
1 Byte (8 Bits)

Table 4-7 shows the ASCII character for each possible nibble value.

Table 4-7 Conversion Table for Binary to ASCII Values

Binary	ASCII	Hex	Octal	Decimal
0000	0	30	060	048
0001	1	31	061	049
0010	2	32	062	050
0011	3	33	063	051
0100	4	34	064	052
0101	5	35	065	053
0110	6	36	066	054
0111	7	37	067	055
1000	8	38	070	056
1001	9	39	071	057
1010	A	41	101	065
1011	B	42	102	066
1100	C	43	103	067
1101	D	44	104	068
1110	E	45	105	069
1111	F	46	106	070

Number of Nibble Values

The number of nibble values that are necessary to define the character depends on the cell size. For example, the default 16x16 cell shown in Figure 4-7 has four nibbles per line for a total of 64 nibble values. However, an 8x16 cell will have only two nibbles per line for a total of 32 nibble values. Table 4-8 shows the total number of nibble values necessary to define the character in each cell size.

Table 4-8 Total Nibble Values

Columns	Lines	Cell Size	Total Nibble Values
80	26	16x20	80
		16x16	64
	52	16x8	32
132	26	10x16	48*
	52	10x8	24*
161	26	8x16	32
	52	8x8	16

* When the character cell is 10 pixels wide, you must add two zeros to the right side of each line to fill out the third nibble.

Recording the Character String

Combine the ASCII characters into a character string (*ds*), working across each line of the cell from left to right, and from top to bottom. When you have finished, verify that you have recorded the correct number of nibble values (Table 4-8) to define the character for your selected cell size.

Loading the Character

The following command loads the example text character B (Figure 4-7) in place of the Ð character in position 80 in font bank 1 (Figure 4-6).

```
DCS 0 ; 1 ; 80 } 00 00 00 00
3F F0 38 0C 38 0C 38 0C 38 1C
3F F0 38 1C 38 0C 38 0C 38 1C
3F F0 00 00 00 00 00 00 ST
```

Controlling the Screen Display

INTRODUCTION

This chapter describes the commands that control how data is displayed on the screen. The bulk of the chapter is devoted to the use of color and the commands that assign display attributes. The main focus of this discussion, which begins with the section entitled “Assigning Display Attributes,” is on

- How colors are associated to other display attributes
- How both colors and other attributes are assigned to characters in the terminal’s four color modes
- How the SGR (select graphic rendition) command is interpreted in each of the four color modes

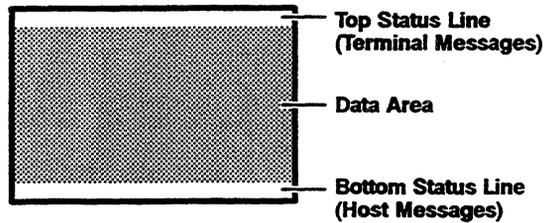

The first part of the chapter describes the commands that control the status line, scrolling, and the definition of erasable and nonerasable characters.

CONTROLLING THE STATUS LINE

The screen can display 26 or 52 lines down the screen and 80, 132, or 161 columns across the screen. Normally, two of the 26 or 52 lines serve as *status lines*, which display messages from the terminal and the host. The remaining area of the screen is the *data area*, available for displaying data from the keyboard or from the host. The functional mode commands that control the size of the screen’s data area are described in Table 2-2 in Chapter 2.

Figure 5-1 shows the three screen areas.

Figure 5-1 Screen Areas

Status Line Messages

The top status line displays *terminal messages* on either a *user* or a *system* status line, selectable in setup mode or with a local key command (`Ctrl` `▶`). The default is a user status line. Tables 5-1 and 5-2 list the top status line messages and their meanings.

Table 5-1 User Status Line Messages

Message	Description
*	The terminal is in controls display mode.
BLCK	The terminal is on-line in block communication mode.
CAPS	The LOCK (CAPS LOCK) key is engaged.
COMP ¹	A compose character sequence is in process.
CPRT	Autoprint (copy print, auxiliary print) mode is on.
HBLK	The terminal is on-line in half-duplex block communication mode.
HDX	The terminal is on-line in half-duplex communication mode.
HOLD	Data is being held on the screen (processing is suspended).
INS	Insert mode is on.
LINE	The terminal is on-line in full-duplex communication mode.
LOCL	The terminal is in local operating mode.
<i>p:lll-ccc</i> ¹	The page, line, and column number of cursor position.

1. ANSI personalities only.

Table 5-1 User Status Line Messages, Continued

Message	Description
PROT ²	Protect mode is on.
WAIT	Keyboard has been locked.
WRPT ³	Write-protect mode is on.
XPRT	Controller print (transparent print) mode is on.

2. ASCII personalities only.
3. ASCII personalities only. Displayed only when protect mode is also on.

Table 5-2 System Status Line Messages

Message	Description
AUX	Identifies port to which auxiliary device is connected
<i>day mo yr hr:min*</i>	Displays date and time
HOST	Identifies port to which host is connected
PRNT	Identifies port to which printer is connected
SESSION	Identifies active session (01 or 02)

* Displayed only if time has been set in WyseWorks mode or through a command sequence (WYDISET). If an alarm has been set, the message field replaces the date and time field when the alarm bell rings.

The bottom status line displays *host messages*. If the extra data line is enabled in setup mode or by a functional mode command (WYEXTDM), the bottom status line is not displayed.

You can control the display of the top and bottom status lines.

Selecting the Status Line Type

DECSSDT

Select status line type

CSI Ps \$ ~

where Ps is the type of status line display

Ps	Type Displayed
0	No status line display
1	Top status line (displays terminal status messages)
2	Top and bottom status lines (bottom status line displays messages received from host)

With this command you can turn on the top and bottom status line, display the top status line only, or turn off both status line displays. The top status line displayed when the command is executed is the *user status line*.

If the extra data line has been enabled (WYEXTDM) when the command is sent to display a top and bottom status line, only the top status line is displayed.

Writing Data to the Bottom Status Line

DECSASD

Select data destination

CSI *Ps* \$ }

where *Ps* is the data destination.

<i>Ps</i>	Destination
0	Data sent to screen's data area
1	Data sent to bottom status line (ignored if WYEXTDM is set)

Data can be written to the bottom status line if the bottom status line display is enabled (DECSSDT). When data is written to the bottom status line,

- The cursor is not displayed in the status line (it remains in the data area)
- All commands that move the cursor to another page are ignored (NP, PP, PPA, PPB, PPR)
- The commands listed in Table 5-3 have different effects than when data is written to the data area.

Table 5-3 Command Differences (Data Written to Status Line)

Mnemonic	Effect of Command	
	Data to Data Area	Data to Status Line
CNL	Cursor moves to next line	Cursor moves to column 1
CPL	Cursor moves to previous line	Cursor moves to column 1
CUD VPR	Cursor moves down <i>n</i> lines	Ignored
CUP HVP	Cursor moves to line <i>n</i> , column <i>n</i>	Cursor moves to column <i>n</i> only
CUU	Cursor moves up <i>n</i> lines	Ignored
DECALN	Screen adjustment pattern is displayed	Ignored
DECANM	VT52 personality is selected	Ignored

Table 5-3 Command Differences (Data Written to Status Line), Continued

Mnemonic	Effect of Command	
	Data to Data Area	Data to Status Line
DECSCCL	Select terminal personality	Ignored
DECSTR	Soft reset occurs	Further data is sent to screen's data area
DL	n blank lines are deleted	Ignored
IL	n blank lines are inserted	Ignored
IND	Cursor moves down one line in current column	Data is cleared from status line
LF VT FF	Cursor moves down one line in current column	Data is cleared from status line
RI	Cursor moves up one line in current column	Data is cleared from status line
RIS	Hard terminal reset occurs	Status line is erased, and further data is sent to screen's data area
VPA	Cursor moves to line n	Ignored

SCROLLING

DECSTBM Define scrolling region CSI P_n ; $P_n I$ r

where P_n is the line number of the top line of the scrolling region (optional)

$P_n I$ is the line number of the bottom line of the scrolling region (optional)

If P_n is omitted, the top line of the scrolling region defaults to the first data line on the page. If $P_n I$ is omitted, the bottom line of the scrolling region defaults to the last data line on the page.

If $P_n I$ is less than P_n , or is greater than the number of lines on the page, the command is ignored.

This control sequence defines the top and bottom margins of the scrolling region (the active data area of the page).

WYSCRATE **Set smooth scroll rate** **CSI Ps z**

where *Ps* is the number of lines per second

<i>Ps</i>	Scroll Rate
0	4 lines per second (default)
1	1 line per second
2	2 lines per second
3	4 lines per second
4	8 lines per second

This control sequence selects the scrolling rate if smooth scrolling has been selected (DECSCLM).

CONTROLLING THE ERASABILITY OF CHARACTERS

DECSCA **Define erasable/nonerasable characters** **CSI Ps ” q**

where *Ps* defines succeeding characters as erasable or nonerasable by a selective erase control sequence

<i>Ps</i>	Character Erasability
0 or 2	Erasable. Characters are erased by a selective erase control sequence.
1	Nonerasable. Characters are not erased by a selective erase control sequence.

This command allows you to designate which characters will or will not be erased by the selective erase control sequences DECSED and DECSEL (see Chapter 8).

- Note** When the WYENAT functional mode is set (see Chapter 2), this command can be used in connection with the SGR command (described later in this chapter) to assign display attributes separately to erasable and nonerasable characters.

ASSIGNING DISPLAY ATTRIBUTES

Display attributes are visual properties that affect the way characters appear on the screen. On a monochrome terminal, programs differentiate between areas of the screen and make some characters stand out visually by changing their intensity—making them bolder or dimmer—and by making them blink, underlined, reversed, or invisible (blank). For example,

- The first letter of a menu option can be assigned the bold attribute to indicate to the user what key to press to select that option
- Blinking characters can attract the user's attention to an error message

- A screen area that would otherwise display sensitive information, such as a password, can be blanked out so that the password will be invisible as it is entered

On a color terminal, characters are distinguished by color instead of or in addition to these traditional monochrome display attributes. By combining the terminal's 64 colors with 16 possible attribute combinations, you can achieve a variety of effective visual presentations.

Display Attribute Combinations

The terminal's display attributes are divided into two types:

- *Base character attributes* that correspond to the three intensities *normal*, *dim*, and *bold*. Every character displayed on the screen exhibits one—and only one—of these attributes, which are mutually exclusive. For example, a character cannot be displayed as normal and bold at the same time.
- *Associated attributes*, which can be added to each base character attribute either singly or in any combination. The associated attributes are *blink*, *blank*, *reverse*, and *underline*.

Combining a base character attribute with associated attributes results in 16 possible combinations. One of the sixteen is “none” (or “normal”) meaning a base character attribute “without associated attributes” (and therefore distinguished by color alone).

The Basic SGR Command

The basic command that assigns display attributes to characters is the SGR (*select graphic rendition*) command. The SGR command is discussed in this section in relation to the terminal's default color map mode, in which only parameter values between 0 and 29 can be used. The color-specific parameter values 30 through 37 and 40 through 47 are discussed in a later section entitled “Color Extended SGR Mode.”

SGR

Assign character attributes

CSI P_s ; ... ; P_s m

where P_s specifies the assigned attribute

Table 5-4 lists the attribute values for P_s and describes the selected attributes.

**Table 5-4 Attribute Values
(Nonextended)**

<i>Ps</i>	Attribute	Description ¹
0	Normal	Displays normal characters with no associated attributes (resets all other attributes)
1	Bold	Displays bold characters (resets dim and blank)
2	Dim	Displays dim characters (resets bold and blank)
4	Underline	Displays underlined characters
5	Blink	Displays blinking characters
7	Reverse	Displays reversed characters (exchanges foreground and background colors)
8	Blank	Makes all received characters invisible ²
9	Overstrike ³	Displays characters with a line through them
22	Normal base attribute	Displays normal characters (resets bold, dim, and blank attributes)
24	Underline off	Displays characters without an underline (resets underline attribute)
25	Blink off	Displays nonblinking characters (resets blink attribute)
27	Reverse off	Restores characters to assigned foreground and background colors
28	Blank off	Displays characters (resets blank attribute)
29	Overstrike off	Displays characters without a line through them (resets overstrike attribute)

1. The terms *normal*, *bold*, and *dim* describe colors, not intensities.

2. In Intecolor 220 personality, also resets dim and bold.

3. You can position the overstrike anywhere on the character or use it to create a double underline (see WYSOVR).

The following principles apply to the basic SGR command:

- Attributes do not occupy a character position on the screen.
- You can combine attributes by entering multiple parameters within the command sequence and separating them with semicolons (;).

- The terminal recognizes the attributes in the order received, combining them with previously selected attributes unless the most recent selection resets one or more of them.
- Attributes affect only characters received by the terminal after the command is executed (i.e., the command will not change the appearance of data already displayed on the screen).
- The way in which the attributes are associated with character colors depends on the terminal's current *color mode*. The color modes are introduced in the section entitled "Working with Color," and the effect of the SGR command in each mode is discussed in succeeding sections.

Combining Attributes

The following example describes the way attributes are combined.

1 To display bold and blinking characters, send

CSI 1 ; 5 m

2 Sending the sequence

CSI 4 m

adds an underline. The characters remain bold and blinking.

3 Subsequently sending the sequence

CSI 24 ; 25 m

removes the underline and turns off blinking, leaving bold characters with no associated attributes

Selecting the Overstrike Position

WYSOVR

Select overstrike position

CSI 53 ; *Pn* w

where *Pn* is the line number (0 through 19) in the character cell where the overstrike is positioned (0 is the top line of the cell)

This control sequence selects the position where an overstrike line selected by the SGR command will appear on the character (see Chapter 4 for character cell dimensions). For example, in the default 16x16 character cell size, the values for *Pn* are 0 through 15. Sending the command

CSI 53 ; 8 w

positions the overstrike through the middle of the character.

You can create a double underline by assigning both an underline and overstrike attribute and positioning the overstrike on the second from the bottom line of the cell. For example, for a 16x16 character cell, sending the WYSOVR command

CSI 53 ; 13 w

followed by the SGR command

CSI 4 ; 9 m

displays subsequently entered characters with a double underline.

WORKING WITH COLOR

You can program the terminal in any one of four separate color modes. Table 5-5 briefly compares the four color modes that are described in detail in the following sections.

Table 5-5 Color Modes

Mode	Description
Color Map (default)	Assign foreground and background colors to an array of color and display attribute combinations called a <i>color map</i> ; redefine the color map, selecting from 64 available colors and 16 attribute definitions. Commands: WYCOLOR, WYCAA
Color Extended SGR	Assign foreground and background colors directly to characters, selecting from eight foreground and eight background extended color values of the SGR command (without reference to the color map). Command: SGR
Color Direct	Assign foreground and background colors and attributes directly to characters (without reference to the color map); select from 64 available colors and 16 attribute combinations. Command: WYCDIR
Color Index	Create a customized color index by assigning your own numbers to the terminal's 64 colors; assign foreground and background colors directly to characters using these number values (without reference to the color map). Command: WYIND

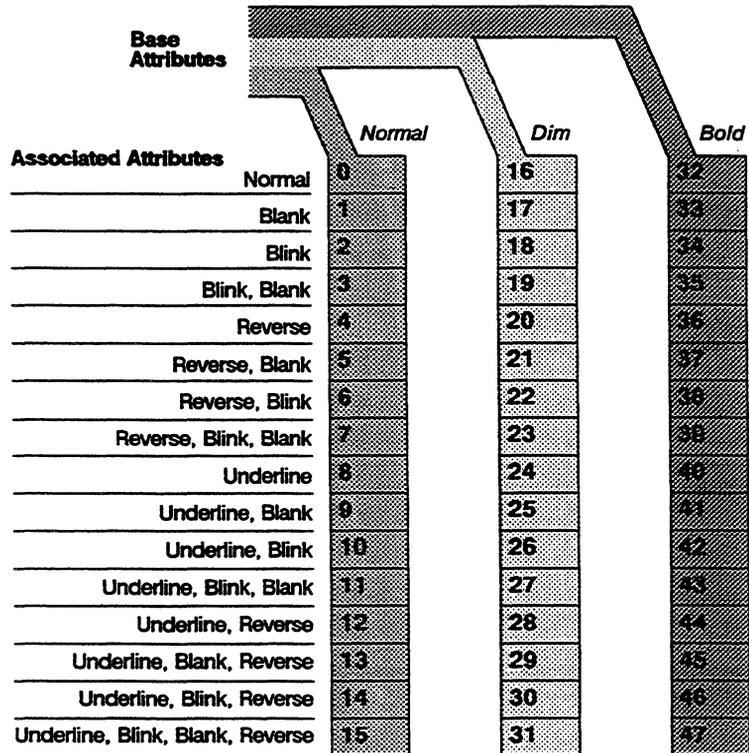

COLOR MAP MODE

Color map mode is the terminal's default color mode. It is the basis for the color and attribute selections made from the Attribute menu in setup mode.

In color map mode, colors are not assigned directly to characters. Instead, they are associated (*mapped*) to the display attributes assigned by the SGR command. The arrangement of colors and

display attributes from which the terminal makes these color/attribute associations is called a *color map*. Figure 5-2 shows the basic structure of the color map.

Figure 5-2 The Structure of the Color Map

The Color Map Attribute Associations

Each of the 48 numbered map positions in Figure 5-2 is called an *attribute association*. An attribute association is composed of a color and a particular combination of *base character attribute* and *associated attributes*.

- **Note** The three mutually exclusive base character attributes (normal, dim, or bold) multiplied by 16 associated attributes (blink, blank, reverse, and underline and their combinations) results in 48 possibilities for distinguishing characters displayed on the screen.

Characters are displayed in the color of the *one* attribute association that corresponds to the attributes assigned to them by the SGR command. For example, characters assigned only the blink attribute take their color from position 2 on the map. Characters assigned both the dim and blink attributes take their color from position 18; if an underline attribute is added to the dim and blink attributes, the characters pick up the color of the attribute association represented by position 26.

Introduction to Color Map Mode Commands

Three WYCOLOR command sequences determine the colors assigned to the attribute associations, as follows:

- 1 The command that assigns foreground colors assigns three separate colors simultaneously—one color to the *normal* attribute, another color to the *dim* attribute, and a third color to the *bold* attribute. Initially, as represented by the three shaded columns in Figure 5-2, the three colors of this *foreground color palette* extend to all the associated attributes that can be combined with a given base character attribute.
 - 2 The command that assigns background colors assigns a common background color to all attribute associations (and to the border of the screen).
 - 3 The third command redefines any one of the 48 individual attribute associations
 - To display in a different foreground and/or background color from the palette-assigned foreground color or the previously assigned background color.
 - To display different visual properties from its default definition by *adding* another associated attribute (blink, blank, underline, reverse) or *subtracting* one or more of the associated attributes that make up the default definition.
- Note** Although you can select either the foreground color palette or the background color first, you must redefine an attribute association *after* selecting the foreground color palette. The command that selects a foreground color palette extends the new palette colors to all positions on the color map and resets all the attribute associations to their default definitions.

The commands in color map mode are easy to apply to existing applications because the color map automatically translates the program's existing display attributes into your selected colors or attribute redefinitions. For example, you can make all your color

selections ahead of time instead of having to mix color commands into the middle of the program.

The ability to redefine individual attribute associations makes it possible, for example, to do away with some or all blinking characters while still preserving their information value. For example, what might have been a bold, *blinking* green character on a white background could be redefined to be a bold *reversed* white character on a green background.

Selecting a Foreground Color Palette

WYCOLOR **Select foreground color palette** **CSI 48 ; Ps w**
 where *Ps* is a value from Table 5-6 selecting the foreground color palette

Table 5-6 Foreground Color Palettes

<i>Ps</i>	Base Character Attributes		
	Normal*	Dim*	Bold*
0	White	Charcoal gray	Gray
1	Red	Pale pink	Light purple
2	Blue	Light blue-purple	Electric blue
3	Amber	Orange-brown	Red-orange
4	Intecolor (green)	(Blue)	(White)
5	Black	Gray	Charcoal gray
6	Bright green	Grass green	Green
7	Pale cyan	Turquoise	Cyan

* These names are for convenience of reference in relation to traditional monochrome attributes. The actual colors don't necessarily carry any direct relationship to intensities such as brightness or dimness.

When you select a foreground color palette,

- The previous foreground color palette is overwritten with the new color palette
- All associated attributes are reset to their default definitions in the new foreground color

This command selects the foreground colors for all characters received after the command is executed. Characters already displayed retain their previously defined colors and attributes.

Figure 5-3 illustrates on the color map the effect of sending the command

CSI 48 ; 1 w

to select a red foreground color palette. Each base character attribute is assigned a separate color, which extends to all its associated attributes.

Characters assigned attributes by the SGR command pick up the corresponding foreground color from the color map. For example, sending

CSI 2 ; 5 m

(assigning dim and blink) displays a pale pink, blinking character (position 18 on the map). Sending

CSI 1 ; 4 ; 25 m

(assigning bold and underline and turning off blink) displays a light purple underlined character (map position 40).

Figure 5-3 Selecting the Foreground Color Palette

Underline, Blink, Blank, Reverse	15	31	47

Selecting a Background Color

WYCOLOR

Select background color

CSI 49 ; Ps w

where Ps is a value from 0 to 64 from Table 5-7

This command assigns any one of 64 colors to the background of all characters received after the command is executed.

The selected background color also becomes the color of the screen border. (See "Mode-Independent Color Commands" later in this chapter for the WYCOLOR command that allows you to assign a separate color to the border.)

Table 5-7 Color Table*

<i>Ps</i>	Color	<i>Ps</i>	Color	<i>Ps</i>	Color	<i>Ps</i>	Color
0	Default	17	Brick red	34	Rose	51	Magenta
1	Black	18	Violet	35	Medium purple	52	Light purple
2	Dark blue	19	Indigo	36	Purple	53	Red-orange
3	Deep blue	20	Blue-purple	37	Orange brown	54	Pale pink
4	Blue	21	Khaki-green	38	Faded rose	55	Purple pink
5	Grass green	22	Charcoal gray	39	Purple-gray	56	Light violet
6	Teal blue	23	Powder blue	40	Purple-blue	57	Amber
7	Electric blue	24	Medium blue	41	Dull chartreuse	58	Tan
8	Bright blue	25	Medium green	42	Sage green	59	Faded purple
9	Bright green	26	Green-blue	43	Gray	60	Pale purple
10	Light blue-green	27	Blue-gray	44	Light blue-purple	61	Yellow
11	Turquoise	28	Light blue	45	Chartreuse	62	Pale yellow
12	Sky blue	29	Lime green	46	Pale green	63	Cream
13	Green	30	Seafoam green	47	Faded blue-green	64	White
14	Sea green	31	Pale blue-green	48	Pale cyan		
15	Blue-green	32	Light cyan	49	Red		
16	Cyan	33	Deep red	50	Hot pink		

* Color names are for convenience of reference and are not based on any scientific or artistic criteria. The names are intended only as guidelines within a range of colors.

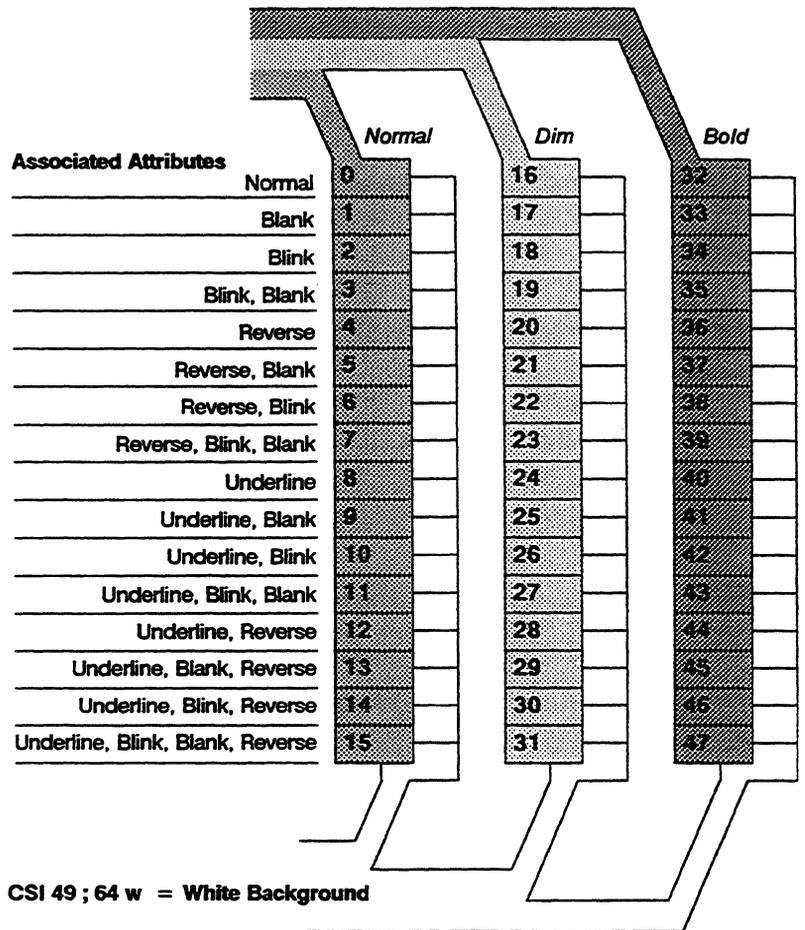

Figure 5-4 illustrates on the color map the effect of sending the command

CSI 49 ; 64 w

to select a white background color. All attribute associations are assigned the same background color.

- Note** This command changes the background color of the characters as they are entered, not the background of the entire screen. Filling the screen with the background color can only be done with a clear command, such as DECSED (see Chapter 8), which is also affected by the setting of the WYREPL functional mode command (see Chapter 2).

Figure 5-4 Selecting a Background Color

Redefining an Attribute Association

WYCAA

Redefine character attribute association CSI *Ps* ; *Ps1* ; *Ps2* ; *Ps3* w

where *Ps* is a value from 0 through 47 from Table 5-8 that specifies the existing attribute association to be redefined. (These values

correspond to the numbers for the color map positions on the figures illustrating the color map.)

Ps1 is a value from 0 through 64 from Table 5-7 assigning a new foreground color

Ps2 is a value from 0 through 64 from Table 5-7 assigning a new background color

Ps3 is a value from 0 through 15 from Table 5-9 specifying a new definition for the attribute association specified by *Ps*.

This command redefines one of the 48 attribute associations represented on the color map. Only characters subsequently received by the terminal are affected; characters previously displayed remain unchanged.

- Note** If the attributes being redefined (*Ps*) are not currently assigned to characters, you won't see any effect on the screen until you assign them with the SGR command.

Table 5-8 The Attribute Associations

Associated Attribute	Base Character Attribute		
	Normal <i>Ps</i>	Dim <i>Ps</i>	Bold <i>Ps</i>
Normal (no attributes)	0	16	32
Blank	1	17	33
Blink	2	18	34
Blink and blank	3	19	35
Reverse	4	20	36
Reverse and blank	5	21	37
Reverse and blink	6	22	38
Reverse, blink, and blank	7	23	39
Underline	8	24	40
Underline and blank	9	25	41
Underline and blink	10	26	42
Underline, blank, and blink	11	27	43
Underline and reverse	12	28	44
Underline, blank, and reverse	13	29	45
Underline, blink, and reverse	14	30	46
Underline, blank, blink, and reverse	15	31	47

Table 5-9 Associated Attribute Values

<i>Ps3</i>	Associated Attribute	<i>Ps3</i>	Associated Attribute
0	Normal	8	Underline
1	Blank	9	Blank, underline
2	Blink	10	Blink, underline
3	Blank and blink	11	Blank, blink, and underline
4	Reverse	12	Reverse and underline
5	Blank and reverse	13	Blank, reverse, and underline
6	Blink and reverse	14	Blink, reverse, and underline
7	Blank, blink, and reverse	15	Blank, blink, reverse, and underline

Figure 5-5 shows the result of sending the command

CSI 42 ; 13 ; 63 ; 8 w

where

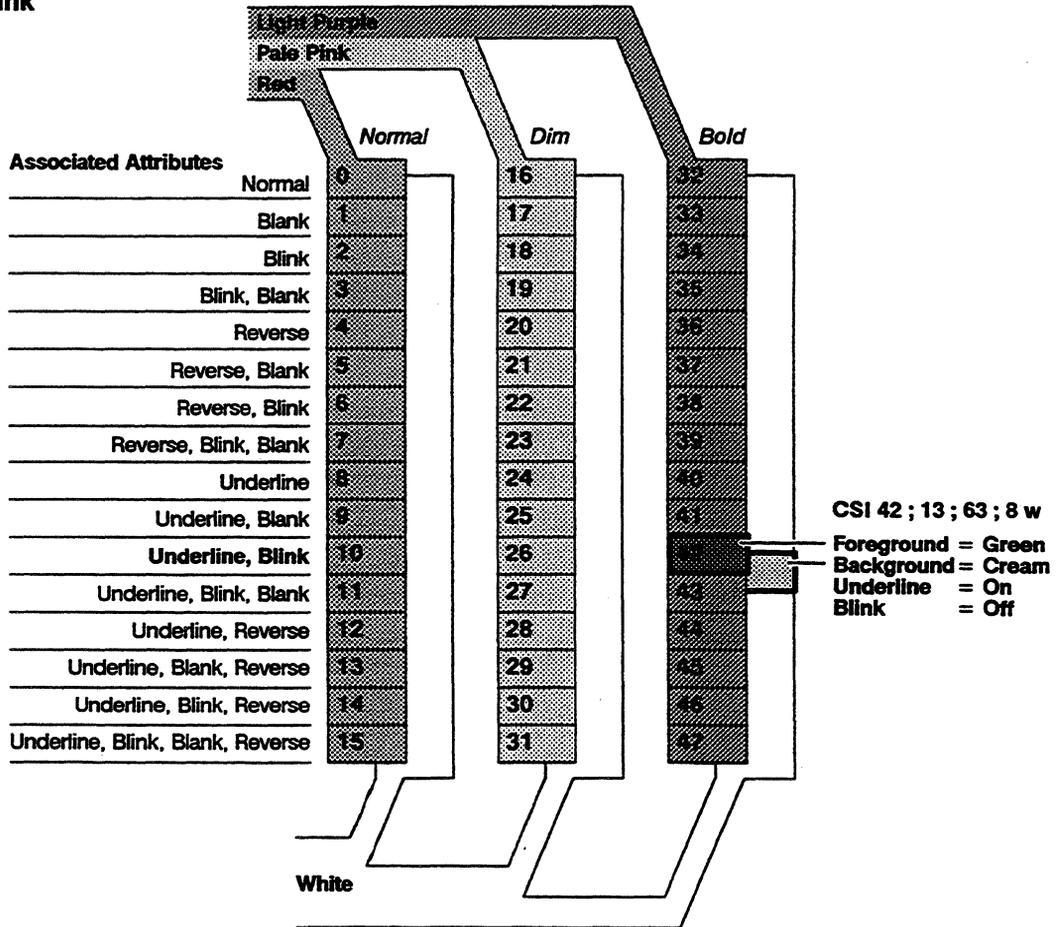

42 from Table 5-8 specifies position 42 on the color map, which consists of a light purple bold base character attribute associated to underline and blinking

13 selects a new foreground color (*green* from Table 5-7) for this attribute association

63 selects a new background color (*cream* from Table 5-7) for this attribute association

8 selects *underline* from Table 5-9, specifying underline only as the new definition of this attribute association (therefore turning off blink)

Figure 5-5 Redefining Bold, Underline, Blink

From now on, formerly light purple underlined, blinking characters on a white background are displayed instead as underlined, nonblinking green characters on a cream background.

The attribute associations are completely independent of one another. The command illustrated in Figure 5-5 has *no effect* on any other attribute associations, including

- Normal (position 10) or dim (position 26) characters associated with underline and blink; they continue to display the palette-assigned colors.
- Any other attribute association for bold characters (color map positions 32 through 47). For example, the command does *not* turn off blink for any other attribute association that has blink “on” (positions 34, 35, 38, 39, 43, 46, and 47); they continue to display their default definitions, which include blink.

Effect of Basic SGR Command in Color Map Mode

The effect of a basic SGR command sequence sent in color map mode depends on the current color map definitions. Attributes are additive, as they normally are with the SGR command. For example, given the color map definitions illustrated in Figures 5-3, 5-4, and 5-5, sending

CSI 0 ; 4 m

would display a red underlined character on a white background (map position 8). If the terminal then received

CSI 7 m

it would reverse the foreground and background colors to display white underlined characters on a red background (map position 12). Subsequently sending

CSI 2 ; 27 m

(turning on dim and turning off reverse) would display pale pink underlined characters on a white background (map position 24).

The following example demonstrates how an SGR command is interpreted if an attribute association has been redefined. Given the color map shown in Figure 5-5, the sequence

CSI 1 ; 5 m

would display light purple blinking characters on a white background (map position 34). If the terminal subsequently received the SGR sequence assigning the underline attribute

CSI 4 m

it would *not display* light purple underlined, blinking characters. Instead, picking up the attribute association representing bold, underlined, blinking characters (map position 42, which has been

redefined), the terminal would display green underlined (nonblinking) characters on a cream background.

Restoring Colors and Attribute Definitions

WYCOLOR **Restore foreground and background colors to last saved in nonvolatile memory** **CSI 50 w**

This command restores the foreground color palette and background color last saved in setup mode, resetting the border color to the color of the background.

COLOR EXTENDED SGR MODE

This section describes the use of the extended color parameters of the SGR command. In this mode the terminal is limited to one of eight foreground and eight background colors, which are assigned directly to the current character.

SGR **Assign character attribute** **CSI Ps ; ... ; Ps m**

where *Ps* is an extended color value from Table 5-10

Table 5-10 SGR Extended Color Values

<i>Ps</i>	Foreground Color			Background Color
	Normal	Dim ¹	Bold ²	
30	Black	Charcoal gray	Black	
31	Red	Brick red	Hot pink	
32	Green	Pale green	Bright green	
33	Yellow	Pale yellow	Amber	
34	Blue	Light blue	Bright blue	
35	Magenta	Pale pink	Purple pink	
36	Cyan	Pale cyan	Turquoise	
37	White ³	Gray	White	
40				Black ³
41				Red
42				Green
43				Yellow
44				Blue
45				Magenta
46				Cyan
47				White

1. When dim attribute is also assigned
 2. When bold attribute is also assigned
 3. Default
-

Specifying any of the parameter values in Table 5-10 in an SGR command automatically takes the terminal out of the default color map mode and into color extended SGR mode. In this mode the terminal does not have access to the color map. Instead, the foreground and/or background color of subsequently received characters is set directly to one of eight basic colors.

If the foreground color is not specified, characters are displayed in the default white foreground color; if the background color is not specified, characters are displayed on the default black background.

You can combine the color extended parameter values with any of the other attribute values in the basic SGR command *except the reset parameter (0 = Normal)*. The reset parameter turns off color extended SGR mode and returns the terminal to the default color map mode. This would mean that from then on character colors would revert to the color map definitions.

- Note** The terminal adjusts the foreground color as shown in Table 5-10 when the dim or bold (or normal = 22) parameter is specified in the SGR command.

Examples in Color Extended SGR Mode

The following examples demonstrate the effect of the SGR command in color extended SGR mode.

If you send the command

CSI 34 ; 43 m

the terminal displays subsequently received characters as blue on a yellow background. If you then send

CSI 4 m

the terminal turns on underline, and characters are blue and underlined on a yellow background. If you then send

CSI 2 ; 5 m

the foreground color changes to light blue and blink is turned on, resulting in underlined, blinking, light blue characters on a yellow background.

COLOR DIRECT MODE

In color direct mode you can assign any one of the terminal's 64 colors as the foreground or background color and any one of the associated attributes directly to characters. The terminal does not have access to the color map. There are no distinctions between normal, dim, and bold characters.

WYCDIR **Set current character color and attributes** **CSI *Ps* ; *Ps1* ; *Ps2* x**

where *Ps* is a value from 0 through 64 from Table 5-7 that selects the foreground color

Ps1 is a value from 0 through 64 from Table 5-7 that selects the background color

Ps2 is a value from 0 through 15 from Table 5-9 that selects the associated attribute

This command always changes the foreground and background color and resets the attributes of characters received by the terminal after the command is executed. If a parameter value is omitted, the default is selected (e.g., the normal attribute).

Examples of Color Direct Mode Commands

Sending the sequence

CSI 19 ; 61 ; 0 x

displays indigo characters on a yellow background. Sending

CSI 19 ; 61 ; 2 x

displays blinking indigo characters on a yellow background. Subsequently sending

CSI 19 ; 61 ; 6 x

adds the reverse attribute to display blinking yellow characters on an indigo background.

Effect of the SGR Command in Color Direct Mode

Sending the SGR command in color direct mode has the following effects:

- Dim and bold parameter values are ignored
- Specifying the reset (0 = Normal) parameter turns off color direct mode and returns the terminal to the default color map mode
- Specifying an extended color parameter turns off color direct mode and puts the terminal in color extended SGR mode
- All other attributes are simply turned on or off as specified

Example of SGR Command in Color Direct Mode

If you had sent the last WYCDIR command given in the previous example

CSI 19 ; 61 ; 6 x

displaying blinking (reversed) yellow characters on an indigo background, the subsequent SGR command

CSI 4 ; 25 m

would turn on underline and turn off blink. Since the reverse attribute is still on, the terminal would display yellow underlined characters on an indigo background.

COLOR INDEX MODE

Color index mode allows you to create your own customized list of numerical values for the terminal's 64 colors and use those values to assign foreground and background colors to characters. You do this by redefining any or all of the number values (0 to 63) in a default color index (Table 5-11).

Table 5-11 Default Color Index

Index Value	Color	Index Value	Color	Index Value	Color	Index Value	Color
0	Black	16	Brick red	32	Deep red	48	Red
1	Dark blue	17	Violet	33	Rose	49	Hot pink
2	Deep blue	18	Indigo	34	Medium purple	50	Magenta
3	Blue	19	Blue-purple	35	Purple	51	Light purple
4	Grass green	20	Khaki-green	36	Orange brown	52	Red-orange
5	Teal blue	21	Charcoal gray	37	Faded rose	53	Pale pink
6	Electric blue	22	Powder blue	38	Purple-gray	54	Purple pink
7	Bright blue	23	Medium blue	39	Purple-blue	55	Light violet
8	Bright green	24	Medium green	40	Dull chartreuse	56	Amber
9	Light blue-green	25	Green-blue	41	Sage green	57	Tan
10	Turquoise	26	Blue-gray	42	Gray	58	Faded purple
11	Sky blue	27	Light blue	43	Light blue-purple	59	Pale purple
12	Green	28	Lime green	44	Chartreuse	60	Yellow
13	Sea green	29	Seafoam green	45	Pale green	61	Pale yellow
14	Blue-green	30	Pale blue-green	46	Faded blue-green	62	Cream
15	Cyan	31	Light cyan	47	Pale cyan	63	White

For example, you might find it convenient to arrange the 64 colors so that those you perceive as dark colors are grouped together within a certain range of index numbers, medium colors in another range, and the lightest colors in another range.

Establishing the Color Index

WYIND **Turn color index mode on/off** **CSI 63 ; *Ps* w**

<i>Ps</i>	Color Index Mode
0	Off
1	On

WYIND **Redefine color index value** **CSI 66 ; *Ps* ; *PsI* w**

where *Ps* is an index value from Table 5-11 to be redefined

PsI is a value from Table 5-7 specifying the new color to be represented by the index value *Ps*

This command changes the color represented by a numerical value in the default color index.

For example, to redefine the index value 35 from Table 5-11 to represent brick red instead of purple, send

CSI 66 ; 35 ; 17 w

where 17 is the value for brick red from Table 5-7. From now on, until you change the value again or restore the default index values, every time 35 is received in one of the color index mode commands described in the next section the color displayed will be brick red, not purple.

WYIND **Restore default color index values** **CSI 60 w**

This command defaults all index values to the color definitions represented in Table 5-11.

Selecting Colors in Color Index Mode

In color index mode the terminal does not have access to the color map. Colors are assigned directly to the current character without distinction between normal, dim, and bold characters.

WYIND **Assign current character foreground color** **CSI 61 ; *Ps* w**

WYIND **Assign current character background color** **CSI 62 ; *Ps* w**

where *Ps* is a value from the color index (see Table 5-11 for defaults)

Issuing either of these commands turns on color index mode if it is not already turned on.

- Note** If you redefine an index value after assigning a color with either of these commands, you don't need to send these commands again to assign the new color. Changing the index value will change the color of subsequent characters immediately.

WYIND	Assign nonerasable character foreground color	CSI 64 ; Ps w
WYIND	Assign nonerasable character background color	CSI 65 ; Ps w

where *Ps* is a value from the color index (see Table 5-11 for defaults)

These commands allow you to distinguish between nonerasable and erasable characters (defined by DECSCA) by assigning a separate foreground and/or background color to the nonerasable characters.

Effect of the SGR Command in Color Index Mode

Sending the SGR command in color index mode has the following effects:

- Dim and bold parameter values are ignored
- Color extended parameter values are ignored
- All other attributes are simply turned on or off as specified

- Note** Unlike its effect in color direct or color extended SGR modes, the reset parameter (0 = Normal) does not turn off color index mode; it simply resets all other attributes.

MODE-INDEPENDENT COLOR COMMANDS

This section describes commands that control color regardless of the color mode in effect.

Selecting the Border Color

WYCOLOR	Select border color	CSI 51 ; Ps w
----------------	----------------------------	----------------------

where *Ps* is a value from 0 through 64 from Table 5-7 selecting the color of the display border

This command allows you to set the color of the border of the screen.

- Note** In color map mode, if you want the border to display a different color from the screen background, you must issue this command *after* you set the background color.

Example

To define the screen's border as dark blue, send

CSI 51 ; 2 w

Selecting the Cursor Color

You can select a color for the cursor so that it stands out from the foreground or background color.

WYCOLOR **Select cursor color** **CSI 52 ; Ps w**

where *Ps* is a value from 0 through 64 from Table 5-7 selecting the color of the cursor

Selecting the Top Status Line Colors

WYCOLOR **Select user status line attributes and colors** **CSI 54 ; Ps ; Ps1 ; Ps2 w**

WYCOLOR **Select system status line attributes and colors** **CSI 55 ; Ps ; Ps1 ; Ps2 w**

where *Ps* is a value from 0 through 64 from Table 5-7 selecting the foreground color

Ps1 is a value from 0 through 64 from Table 5-7 selecting the background color

Ps2 is a value from 0 through 15 from Table 5-9 selecting the attributes

These commands allow you to select attributes and colors for the user and system status lines.

Selecting Replacement and Nonerasable Character Attributes and Colors

You can select attributes and colors for replacement and nonerasable characters.

WYCOLOR **Select replacement character attributes and colors** **CSI 56 ; Ps ; Ps1 ; Ps2 ; Ps3 w**

where *Ps* is a value from 0 through 64 from Table 5-7 selecting the foreground color of the replacement characters.

Ps1 is a value from 0 through 64 from Table 5-7 selecting the background color of the replacement characters.

Ps2 is a value from 0 through 15 from Table 5-9 selecting the attributes for the replacement characters.

Ps3 is a decimal value specifying an ASCII character (from 0 through 255). The default is 32 (SPACE).

This command selects colors and attributes for characters that replace those displayed on the screen. Its effects are evident whenever new lines are scrolled onto the screen or when blank

characters are introduced by the editing commands DCH, DL, ED, DECSER, DECSEL, ECH, EL, IL, and ICH (see Chapter 8).

- **Note** The replacement character's background color is affected by the setting of the WYREPL functional mode command (see Table 2-2 in Chapter 2).

WYCOLOR **Select nonerasable character attributes and color** **CSI 57 ; Ps ; Ps2 ; Ps3 w**

where *Ps* is a value from 0 through 64 from Table 5-7 selecting the foreground color of the nonerasable characters

Ps1 is a value from 0 through 64 from Table 5-7 selecting the background color of the nonerasable characters

Ps2 is a value from 0 through 15 from Table 5-9 selecting the attributes for the nonerasable characters

This command allows you to differentiate nonerasable characters from erasable characters by assigning color and attribute values to the nonerasable characters.

DEFINING LINE ATTRIBUTES

<p>DECDHL DECSWL DECDWL WYDHL</p>	<p>Define line attributes</p>	<p>ESC # Ps</p>
---	--------------------------------------	------------------------

where *Ps* specifies the line attribute.

<i>Ps</i>	Line Attribute
3	Displays the top half of a double-high, double-wide line (DECDHL).
4	Displays the bottom half of a double-high, double-wide line (DECDHL).
5	Displays a normal single-high, single-wide line (DECSWL)
6	Displays a single-high line with double-wide characters (DECDWL)
:	Displays the top half of a double-high line with single-wide characters (WYDHL)
;	Displays the bottom half of a double-high line with single-wide characters (WYDHL)

To display a line with characters twice as wide as normal,

- 1 Begin the line with the ESC # 6 escape sequence
- 2 Enter the line of characters, remembering to enter a maximum of half the number of characters permitted on a normal line

To display a line with characters twice as high as normal,

- 1 Begin the first line with the ESC # : escape sequence
- 2 Enter the line of characters
- 3 Starting in the same column position on the next line, begin the second line with the ESC # ; escape sequence
- 4 Enter the same line of characters entered in step 2

To display a line with characters twice as wide and twice as high as normal,

- 1 Begin the first line with the ESC # 3 escape sequence
- 2 Enter the line of characters, remembering to enter a maximum of half the number of characters permitted on a normal line
- 3 Starting in the same column position on the next line, begin the second line with the ESC # 4 escape sequence
- 4 Enter the same line of characters entered in step 2

Controlling Display Memory

INTRODUCTION

Display memory is the memory in which the terminal stores data. Display memory is divided into *pages* defined in setup mode or by a command sequence (WYDFPG). This chapter describes the commands that allow you to

- Define the page dimensions and the number of pages
- Split the screen to display two pages at the same time and manipulate the data in each page independently
- Address the cursor to another page and control its display
- Adjust the screen display (called *panning*) to see different areas of the page when the page is larger than the screen

SCREEN AND PAGE DISPLAY

The data area of the screen serves as a *window* into a page of display memory. How much of the data on the page can be viewed on the screen at one time depends on the size of the screen display in relation to the size of the page. A page can have the same line and column dimensions as the screen or it can be larger than the screen; it cannot be smaller than the screen.

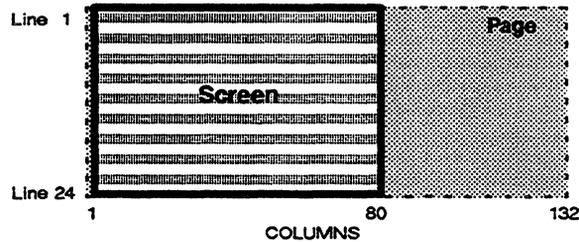

- Note** The only situation in which the page could be said to be “smaller” than the screen is when the screen is configured for 132 or 161 columns and then split vertically to display an 80-column page in each window of the split screen.

The screen size is defined in setup mode. The number of data lines displayed on the screen can also be set by the functional mode commands WY52, WY161, and WYEXTDM (see Chapter 2). The page size can be defined in setup mode or by a command sequence (WYDFPG). The terminal’s default configuration, illustrated in Figure 6-1, is as follows:

- A single session
- One page of 132 columns and 24 data lines
- A screen size of 80 columns and 24 data lines

Figure 6-1 Default Screen and Page Configuration

Page: 132 columns by 24 lines
Screen: 80 columns by 24 lines

Sessions

The data processing activity resulting from the communication between the terminal and a host connected to one of the terminal's ports is called a *session*. In a *single session* the terminal is communicating through only one port. In *dual sessions* the terminal is communicating through two ports with one or more hosts—in effect it becomes two terminals, both of which can receive data and display it on the screen.

In a single session the entire screen can display the data coming from the host, or the data can be displayed on two pages in separate portions of a vertically or horizontally split screen. Each portion of the split screen is called a *window*.

In dual sessions, each session can be displayed on a full screen, one at a time. Or both sessions can be displayed at the same time on the two windows of a horizontally or vertically split screen; in this case the terminal displays a page from each session. Only one session can receive data from the keyboard. The session that is currently receiving data from the keyboard is called the *active session*.

Dual sessions are established by the user in setup mode. The characteristics of each session—such as personality, on-line or local communications mode, status line type, colors, and page and screen configurations—are defined separately. Configuring the terminal for dual sessions in setup mode is described in detail in the *WY-370 User's Guide*.

- **Note** Selecting dual sessions clears all existing softfonts, and a font loaded in one session overwrites the last font loaded by either session.

Table 6-1 summarizes the local keyboard commands that control sessions, pages, and the windows of a split screen.

Table 6-1 Local Keyboard Commands

Command	Keyboard Style		
	105-Key ANSI	ASCII	Enhanced PC
Display next page	Ctrl Shift Next Scrn	Ctrl Next Page	Ctrl Page Down
Display previous page	Ctrl Shift Prev Scrn	Ctrl Prev Page	Ctrl Page Up
Activate other session	F4	Ctrl Shift Setup	Ctrl End
Select dual-session screen format	Ctrl F4	Ctrl Shift - kpd	Ctrl Shift - kpd
Activate other window*	Ctrl Shift F4	Ctrl Shift , kpd	Ctrl Shift + kpd
Move split point left (vertical split) or up (horizontal split)	Ctrl - kpd	Ctrl - kpd	Ctrl - kpd
Move split point right (vertical split) or down (horizontal split)	Ctrl , kpd	Ctrl , kpd	Ctrl + kpd
Toggle to other user-defined key buffer, if both are attached to active session	Ctrl Select	Ctrl Home	Ctrl Home

* Command is effective whether the windows are displaying two sessions or two pages from the same session.

CONTROLLING PAGES AND WINDOWS

The command sequences described in this section allow your program to

- Define the number and size of the pages for a session
- Split the screen, horizontally or vertically, to display two pages of a single session
- Activate the page in either window of a single session
- Manipulate the size of the windows of a split screen (whether the windows are displaying two pages of a single session or displaying two sessions)

Defining Pages

The WYDFPG command defines the number of pages and the number of lines and columns in a page for a session. The validity of certain combinations of page size and number of pages depends on (1) whether the terminal is operating a single session or dual sessions; (2) whether additional memory has been added to the terminal. These considerations are discussed in the section entitled "Valid Page Configurations" later in this chapter.

WYDFPG**Define page for session****CSI 59 ; Ps ; Ps1 ; Ps2 ; Ps3 w**

where *Ps* selects the number of pages for a session. The terminal's standard memory can be divided into a maximum of three (*total*) pages. Four pages *per session* are available when additional memory has been installed.

<i>Ps</i>	Number of Pages
0 or 1	1 (default)
2	2
3	3
4	4

Ps1 selects the number of columns in the page.

<i>Ps1</i>	Number of Columns
0	80
1	132 (default)
2	161

Ps2 defines the basic configuration of page lines on which the total number of lines in the page is based (when multiplied by the *Ps3* multiplier)

<i>Ps2</i>	Page Lines Definition
0	24/25 (default)
1	50/51

Ps3 is the page lines multiplier; a multiplier of 4 is valid only if additional memory has been installed in the terminal.

<i>Ps3</i>	Page Lines Multiplier
0	1 (default)
1	2
2	4

Table 6-2 lists the total number of lines in the page that result from multiplying the page lines definition (*Ps2*) by the page lines multiplier (*Ps3*).

Table 6-2 Total Lines in Page

Page Lines Definition	Total Lines		
	(x1)	(x2)	(x4)
24/25	24 (or 25*)	50	100
50/51	50 (or 51*)	102	204

* Displayed only when the extra data line has been enabled in setup mode or with the WYEXTDM functional mode command.

Executing the WYDFPG command

- Clears all pages
- Forces the screen size to 24 lines by 80 columns
- Restores a full screen if the screen has been split between two pages of a single session
- Does not remove the split from a screen split between sessions

Examples of Page Definition

To define one page of 50 lines and 80 columns so that the user can pan vertically through one long page on a 24-line, 80-column screen, send

```
CSI 59 ; 1 ; 0 ; 0 ; 1 w
```

where 1 selects one page; 1 selects 80 columns; 0 selects a page lines definition of 24/25 lines; 1 is a multiplier of 2.

The same amount of display memory can be configured as two 24- or 25-line, 80-column pages

```
CSI 59 ; 2 ; 0 ; 0 ; 0 w
```

that can either be displayed one at a time on a full 24- or 25-line, 80-column screen, or displayed

- side by side on a vertically split screen
- one above the other on a horizontally split screen

If the screen is split vertically, the first 40 columns of page 1 are displayed on the left side of the screen, and the first 39 columns of page 2 are displayed on the right side of the screen. The data on the remaining portion of either page can be viewed by panning horizontally (see "Panning" later in this chapter).

- Note** One column is taken up by the vertical band that separates the two windows of the split screen. There is no visible separator when the screen is split horizontally.

If the screen is split horizontally, 12 lines of page 1 are displayed in the top window, and 12 (or 13) lines of page 2 are displayed in the bottom window. The remaining lines in each page can be viewed by panning vertically.

You can define three pages having 24 or 25 lines and 80 columns by sending

CSI 59 ; 3 ; 0 ; 0 ; 0 w

or one 50-line, 132-column page by sending

CSI 59 ; 1 ; 1 ; 1 ; 0 w

- Note** The terminal's standard amount of display memory cannot accommodate more than one 50-line page. The page can be either 80- or 132-columns. One 161-column page is also possible with standard memory as long as it has no more than 24 or 25 lines.

Valid Page Configurations

Table 6-3 provides a guide to valid combinations of page size and number of pages. The numerical values in the table represent the approximate amount of memory used by the various combinations of page lines, page columns, and number of pages. Making full use of the table requires that you know whether or not additional memory has been added to the terminal.

Table 6-3 Page Configuration Values¹

Page Lines	Page Columns	Number of Pages			
		1	2	3	4
24/25	80	2000	4000	6000	8000
	132	3300	6600	9900	13200
	161	4025	8050	12075	16100
50/51 ²	80	4080	8160	12240	16320
	132	6732	13464	20196	26928
	161	8211	16422	24633	
100	80	8000	16000	24000	
	132	13200	26400		
	161	16100			
102	80	8160	16320	24480	
	132	13464	26928		
	161	16422			

1. A blank in any column means the combination is not allowed.

2. Also the total number of lines when the page is 24/25 lines and the page multiplier is 2.

Table 6-3 Page Configuration Values¹, Continued

Page Lines	Page Columns	Number of Pages			
		1	2	3	4
204	80	16320			
	132	26928			
	161				

With the terminal's *standard memory*, page configurations are valid if the value in Table 6-3 does not exceed

- 7012 when the terminal is running a single session
- 6392 when the terminal is running dual sessions

With *expanded memory*, page configurations are valid if the value in Table 6-3 does not exceed

- 31588 when the terminal is running a single session
- 30968 when the terminal is running dual sessions

To calculate how many pages you can define in each situation and how big each of those pages can be,

- 1 Find the page dimensions in the first two columns (Page Lines and Page Columns) of Table 6-3.
- 2 Read across to find the value in the applicable column under Number of Pages. This is the value for one session.
- 3 If you are planning for dual sessions, add the total values from step 2 together.

Controlling the Windows

WYSSPLT**Split screen between pages****CSI Ps v**

where *Ps* selects the type of split, if any

<i>Ps</i>	Type of Split
0	No split (full screen)
1	Horizontal split between two pages
2	Vertical split between two pages

This command splits the screen between two pages of the same session. In dual sessions, the command is ignored if the screen is already split between sessions.

WYSWDW **Activate other window (single session)** **CSI Ps w**

where *Ps* selects one of the windows of a split screen displaying two pages of a single session

<i>Ps</i>	Window
0 or 1	Left or upper window
2	Right or lower window

When the terminal is running a single session, and the screen is split between two pages, this control sequence determines which is the active data page (the page connected to the keyboard and displaying the cursor).

- Note** This command cannot activate the other window when the terminal is operating dual sessions. The other session can be selected only by a local keyboard command.

WYMSPLM **Move split** **CSI Ps ; Pn y**

where *Ps* selects the direction the split in the screen will move (depending on the type of split)

<i>Ps</i>	Direction
0	Up or left
1	Down or right

Pn specifies the number of lines to move the split on a horizontally split screen or the number of columns to move the split on a vertically split screen

This control sequence moves the split point to enlarge one window and shrink the other by the specified number of lines or columns. At least one line or column always remains in the smaller window.

The command moves a split between sessions as well as a split between pages of a single session.

ADDRESSING THE CURSOR IN MULTIPLE PAGES

The commands in this section address the cursor to other pages (when more than one page is defined) and control its position and display. The commands are governed by the following principles:

- You can position the cursor on the new page in one of two ways:
 - *Transfer* the cursor to the same line and column coordinates that define its position on the current page
 - *Save* the cursor to the position it last occupied on the page to which it's addressed
- Whether the new page is displayed or not depends on the status of *page coupling*, as defined in setup mode or by the DECPCCM functional mode command:

- If page coupling is off (DECPCCM reset) the new page is not displayed and the cursor is not visible. Data can be entered at the hidden cursor position.
- If page coupling is on (DECPCCM set), the new page is displayed and the cursor remains visible. This is the default.
- A command to move the cursor to a following page is ignored if the cursor is already on the last page; likewise, any command to move the cursor to a preceding page is ignored if the cursor is already on the first page.

NP **Home cursor on a following page** **CSI P_n U**

where P_n is the number of pages forward (a value of either 0 or 1 moves the cursor to the next page)

PP **Home cursor on a preceding page** **CSI P_n V**

where P_n is the number of pages backward (a value of either 0 or 1 moves the cursor to the previous page)

PPA **Address cursor to a specific page** **CSI P_n ; P_s SPACE P**
WYPPA

where P_n is the number of the page to be displayed (a value of either 0 or 1 displays page 1)

P_s defines the cursor position on the new page

P_s	Define Cursor Position
0	Transfer cursor
1	Save cursor

PPR **Display a following page** **CSI P_n ; P_s SPACE Q**
WYPPR

where P_n is the number of pages forward (a value of either 0 or 1 displays the next page)

P_s defines the cursor position on the new page

P_s	Define Cursor Position
0	Transfer cursor
1	Save cursor

PPB **Display a preceding page** **CSI P_n ; P_s SPACE R**
WYPPB

where P_n is the number of pages backward (a value of either 0 or 1 displays the previous page)

P_s defines the cursor position on the new page

<i>Ps</i>	Define Cursor Position
0	Transfer cursor
1	Save cursor

PANNING

Panning lets the user view data on a page that is larger than the full-screen or split-screen window that is displaying the page.

Panning is different from scrolling:

- In scrolling, you can think of a screen window fixed in position while the data on the page flows up or down relative to the window. Data that scrolls beyond the top or bottom of the page is lost from display memory.
- In panning, you can think of the page of data as fixed in position while the screen window moves up or down or side to side to frame different portions of the data on the page. Panning has no effect on the data.

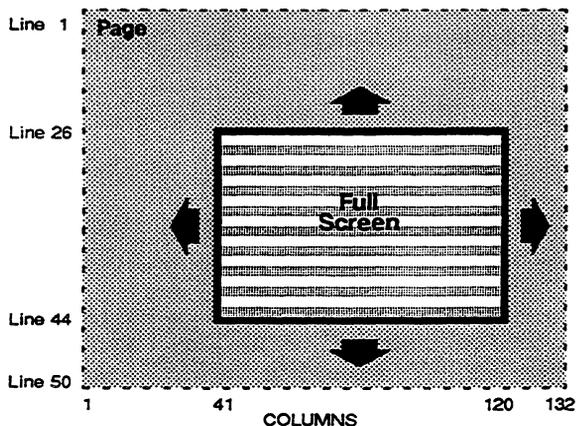

Figure 6-2 illustrates horizontal and vertical panning.

- Note** The Horizontal Windowing setup parameter must be set to *on* for horizontal panning to occur. When Horizontal Windowing is off, the cursor cannot move beyond the right or left edge of the window. The default setting is *off*.

Figure 6-2 Horizontal and Vertical Panning

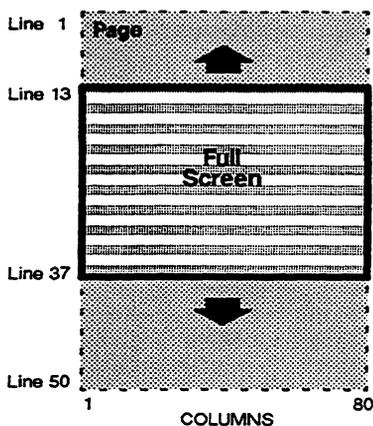

Horizontal and Vertical Panning

Page: 132 columns by 50 lines
Screen: 80 columns by 25 lines

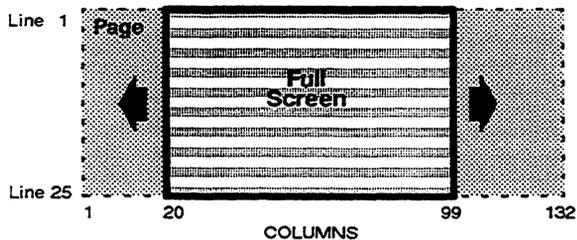

Vertical Panning

Page: 80 columns by 50 lines
Screen: 80 columns by 25 lines

Horizontal Panning

Page: 132 columns by 25 lines
Screen: 80 columns by 25 lines

Horizontal Panning of a Window

Page: 132 columns by 25 lines
Screen: 80 columns by 25 lines
Window: 40 columns by 25 lines

Table 6-4 summarizes the functional mode commands that enable or disable horizontal and vertical panning.

Table 6-4 Panning Commands

Command	Effect	Sequence
DECHCCM*	Pan horizontally, keep cursor in view (default)	CSI ? 60 h
DECHCCM*	Let cursor disappear beyond left or right margin	CSI ? 60 l
DECVCCM	Pan vertically, keep cursor in view (default)	CSI ? 61 h
DECVCCM	Let cursor disappear beyond top or bottom margin	CSI ? 61 l

* Horizontal windowing must be on in setup mode.

Effect of Setup Parameters

The following setup parameters allow the user to control panning, scrolling, and related page and screen functions from the Display menu in setup mode (Display Functions submenu):

- **Autopage:** When Autopage is *off*, the cursor cannot advance to the previous or next page. When Autopage is *on* and the cursor moves past the top or bottom of the page, the cursor goes to the previous or next page. (The default is *off*.)
- **Page Coupling:** When Page Coupling is *on* and the cursor moves to another page, the window displays the page where the cursor is located. When Page Coupling is *off* and the cursor moves to another page, the present page continues to be displayed in the window and the cursor is not visible. (The default is *on*.)
- Note** The Page Coupling parameter also controls the effect of the next-page and previous-page keyboard commands.
- **Horizontal Windowing:** When Horizontal Windowing is *off*, the cursor isn't allowed to move past the right or left edge of data displayed in the window, even if the page contains additional data columns. When Horizontal Windowing is *on*, the cursor can move right or left to the limit of the page. (The default is *off*.)
- **Horizontal Panning:** When Horizontal Panning is *on* (which requires Horizontal Windowing to be *on*) and the cursor moves beyond the right or left of the data displayed in the window, the display adjusts to keep the cursor visible in the window. When

Horizontal Panning is *off* and the cursor moves beyond the data displayed in the window (which requires Horizontal Windowing to be *on*), the cursor won't be visible, although its off-screen position is reported on the user status line. (The default is *on*.)

- **Horizontal Panning Count:** The value specified for Horizontal Panning Count is effective only if Horizontal Panning and Horizontal Windowing are *on*. This value can be set to 1, 2, or 4, which determines how many columns of characters move into the window when the cursor moves one space beyond the window's right or left edge. (The default is 1.)
- **Vertical Autoscroll:** When Vertical Autoscroll is *off*, the cursor cannot advance beyond the top or bottom of the current page. When Vertical Autoscroll is *on* and the cursor is located on the first or last line of the page,
 - The cursor can move up or down a line, which causes a new line to be inserted at the top or bottom of the page (respectively).
 - At the same time, the line of data at the bottom or top of the page (respectively) scrolls off the page.

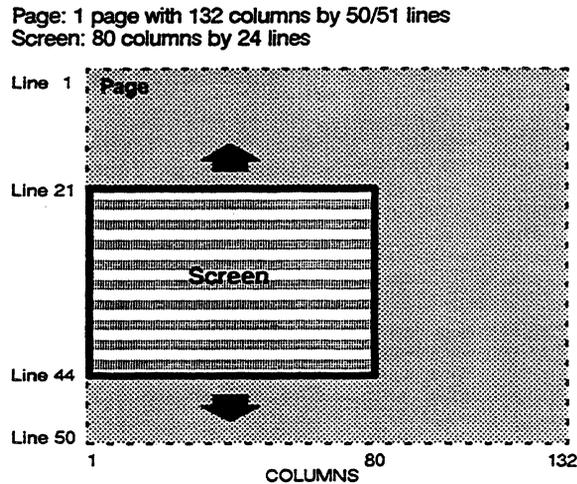

Keep in mind that *scrolling*—not *panning*—is involved here, so the cursor's movement can cause the lines of data to disappear from display memory. (The default is *off*.)

- **Vertical Panning:** When Vertical Panning is *on* and the number of lines on the page is greater than the number of lines on the screen and the cursor moves beyond the top or bottom of the data displayed in the window, the display adjusts to keep the cursor visible in the window. When Vertical Panning is *off* and the cursor moves beyond the data displayed in the window, the cursor won't be visible, although its off-screen position is reported on the user status line. (The default is *on*.)

Example of Panning Defaults

Figure 6-3 shows vertical panning in a 50-line, 132-column page displayed on a 24-line by 80-column screen.

Figure 6-3 Panning Defaults

When the setup parameters on the Display Functions submenu are unchanged from their default settings, the following conditions are in effect for the page and screen illustrated in Figure 6-3:

- The cursor cannot advance beyond column 80 on the right edge of the screen; therefore, no horizontal panning can occur (*Horizontal Windowing off*).
 - The display pans to show each additional line on the screen as the cursor moves past line 24 toward the bottom line of the page (*Vertical Panning on*).
 - When the cursor reaches the last position on the bottom line of the page, it can't go farther; no new blank lines are introduced that would cause data to scroll off the top of the page (*Vertical Autoscrolling off*).
 - If the cursor moves upward in the page, the display again pans to keep the cursor in view (*Vertical Panning on*). When the cursor reaches the top line of the page, no new blank lines are introduced that would cause data to scroll off the bottom of the page (*Vertical Autoscrolling off*).
- Note** In this example, the Autopage and Page Coupling setup parameters don't apply, because only one page is defined. When more than one page is defined, the default *off* setting of the Autopage parameter means that the cursor does not advance to

another page when it reaches the top or bottom of the current page.

7

Controlling the Cursor

CURSOR MOVEMENT COMMANDS

You can move the cursor to any screen location, either from the keyboard or from your program, with the specific control or escape sequences described in this chapter.

- **Note** Cursor movement commands related to paging functions (NP, PP, PPA, PPB, and PPR) are described in Chapter 6.

**CHA
HPA**

Move cursor to specified column

**CSI *Pn* G
or CSI *Pn* `**

where *Pn* is the column number. Default is column 1.

This command moves the cursor to a column on the current line or to the end of the line if the column value exceeds the number of columns between the cursor and the end of the line. The cursor does not wrap to the next line.

CUU

Move cursor up

CSI *Pn* A

where *Pn* is the number of lines the cursor moves up. Default is one line.

This command moves the cursor up a specified number of lines in the current column. If the number of lines exceeds the top margin, the cursor stops at the top line.

**CUD
VPR**

Move cursor down

**CSI *Pn* B
or CSI *Pn* e**

where *Pn* is the number of lines the cursor moves down. Default is one line.

This command moves the cursor down a specified number of lines in the current column. If the number of lines exceeds the bottom margin, the cursor stops on the bottom line.

CUF HPR	Move cursor right	CSI <i>Pn</i> C or CSI <i>Pn</i> a
	where <i>Pn</i> is the number of columns the cursor moves to the right of its current position. Default is one column. If the <i>Pn</i> value exceeds the number of columns to the right, the cursor remains at the end of the line and does not wrap to the next line.	
CUB	Move cursor left	CSI <i>Pn</i> D
	where <i>Pn</i> is the number of columns the cursor moves to the left of its current position. Default is one column. If the <i>Pn</i> value exceeds the number of columns to the left, the cursor remains at the left margin.	
VPA	Move cursor to specified line	CSI <i>Pn</i> d
	where <i>Pn</i> is the line number. Default is line 1. This command moves the cursor to a specified line in the current column, or to the top or bottom line if the specified line is outside the boundaries of the display.	
CUP HVP	Move cursor to specified line and column	CSI <i>Pn</i> ; <i>PnI</i> H CSI <i>Pn</i> ; <i>PnI</i> f
	where <i>Pn</i> is the line number. If <i>Pn</i> is 0 or 1, the cursor moves to the first line. <i>PnI</i> is the column number. If <i>PnI</i> is 0 or 1, the cursor moves to the first column. If you omit <i>Pn</i> , the cursor defaults to line 1; if you omit <i>PnI</i> , the cursor defaults to column 1.	
IND	Move cursor down one line in current column	ESC D or IND
	This command moves the cursor down one line in the current column. If the cursor is at the bottom line of the scrolling region, the display scrolls up one line and the cursor moves to the new bottom line.	
LF VT FF	Move cursor down	CTRL J or CTRL K or CTRL L
	These commands move the cursor down one line in the current column. A carriage return (CR) is executed if newline mode (LNM) is set or if the Received LF setup parameter is set to CRLF.	

RI	Move cursor up one line	ESC M or RI
	This command moves the cursor up one line in the current column. If the cursor is at the top of the scrolling region, the display scrolls down one line and the cursor moves to the new top line.	
NEL	Move cursor down one line and to column 1	ESC E or NEL
	This command moves the cursor to the first column position on the next line. If the cursor is at the bottom line of the scrolling region, the display scrolls up one line and the cursor moves to the first position on the new bottom line.	
CNL	Move cursor down and to column 1	CSI Pn E
	where <i>Pn</i> is the number of lines the cursor moves down. Default is one line.	
	This command moves the cursor to column 1 and down a specified number of lines. If the number of lines exceeds the bottom margin, the cursor remains on the bottom line; the display does not scroll.	
CPL	Move cursor up and to column 1	CSI Pn F
	where <i>Pn</i> is the number of lines the cursor moves up. Default is one line.	
	This command moves the cursor to column 1 and up a specified number of lines. If the number of lines exceeds the top margin, the cursor remains on the top line; the display does not scroll.	
BS	Backspace cursor	CTRL H
	This command moves the cursor one column to the left on the current line. When the start of the line is reached, the cursor stops.	
HT	Tab cursor	CTRL I
	This commands moves the cursor to the next tab stop or to the end of the line; the cursor doesn't wrap to the next line.	
CR	Move cursor to start of line (carriage return)	CTRL M
	This command moves the cursor to the start of the same line. If the Received CR setup parameter is set to CRLF, a linefeed (LF) is also executed.

8

Editing

EDITING FUNCTIONS

The editing functions described in this chapter include commands that erase, insert, and delete characters, control tab settings, and define a rectangular area within a page (draw/clear box).

ERASING, INSERTING, DELETING

Issuing erase, insert, or delete commands results in the addition of blank characters or lines of blank characters to the existing data. These characters are called *replacement characters*.

Replacement Characters

By default, replacement characters are space characters. Other replacement characters can be specified in their place, and/or separate colors and display attributes can be assigned to distinguish the replacement characters from text data:

- A WYCOLOR command assigns colors and attributes to replacement characters and allows you to specify another ASCII character in place of the default space character. This command is described in Chapter 5 in the section, “Selecting Replacement and Nonerasable Character Attributes and Colors.”
- If no WYCOLOR command has been sent to change the color of the replacement characters, the WYREPL functional mode command (Chapter 2) determines their background color. If WYREPL is reset (default), replacement characters are displayed in the background color assigned by the color map. If WYREPL is set, replacement characters are displayed in the background color most recently assigned to the current character.

Erasing

You can erase a specified number of characters, starting at the cursor position (ECH), erase all characters in specified areas of the display (ED), or erase all characters in specified portions of a line (EL). Or you can use the equivalent *selective erase* commands DECSER or DECSEL to erase only those characters defined as erasable by the DECSCA command (described in Chapter 5).

In all these commands the erased characters are replaced by space characters unless the replacement character is otherwise defined (WYCOLOR).

ECH Erase specified number of characters CSI *Pn* X

where *Pn* is the number of characters to be erased, starting at the cursor position

ED Erase in display CSI *Ps* J

where *Ps* is the parameter selecting the area of the display to erase.

Ps **Display Area**

0 Erases all characters and character attributes from the cursor position to the end of the display; also erases line attributes except for current cursor line (Default)

1 Erases all characters and character attributes from the first position of the display area through the cursor position; also erases line attributes except for current cursor line

2 Erases the entire display (characters, character attributes, line attributes)

DECS Erase erasable characters in display CSI ? *Ps* J

where *Ps* is the parameter selecting the area of the display in which to erase the erasable characters

Ps **Display Area**

0 Erases all erasable characters from the cursor position to the end of the display; also erases line attributes except for current cursor line. (Default)

1 Erases all erasable characters from the first position of the display area through the cursor position; also erases line attributes except for current cursor line.

2 Erases all erasable characters.

Erasable characters are characters that have been assigned the erasable character attribute (DECSCA). If DECSCA has not been issued, this command erases all characters in the selected area of the display.

IL **Insert specified number of blank lines** **CSI P_n L**
 where P_n is the number of blank lines to be inserted, starting at the line on which the cursor is positioned
 This command inserts the specified number of blank lines, starting at the cursor line; lines that scroll off the bottom of the page are lost.

Deleting

DCH **Delete specified number of characters** **CSI P_n P**
 where P_n is the number of characters to be deleted, starting at the cursor position
 This command deletes the specified number of characters to the right of the cursor. The effect on existing data depends on the setting of the Page Edit parameter in setup mode:

- When Page Edit is set to *line*, blank characters are added at the end of the line. This is the default.
- When Page Edit is set to *page*, data wraps up to fill the line, and blank characters are added at the end of the page.

DL **Delete specified number of lines** **CSI P_n M**
 where P_n is the number of lines to be deleted, starting from and including the line on which the cursor is positioned
 This command deletes the specified number of lines, starting with the cursor line, adding blank lines at the bottom of the page.

CONTROLLING TABS

TBC **Clear tab stop** **CSI 0 g**
CTC **Clear tab stop** **or CSI 2 W**
 These commands clear the tab stop at the cursor position.

TBC **Clear all tabs** **CSI 3 g**
CTC **Clear all tabs** **or CSI 5 W**
 These commands clear all tab stops.

CTC **Set tab stop at cursor** **CSI 0 W**
HTS **Set tab stop at cursor** **or ESC H**
 These commands set a tab stop at the cursor position.

CTC **Set tab every eighth column** **CSI ? 5 W**
 This command sets a tab stop every eight columns, beginning at column 9 (9, 17, 25, and so on).

CHT	Tab forward	CSI Pn I
	where Pn is the number of tab stops	
HT	Tab forward one tab stop	CTRL I
CBT	Tab backward	CSI Pn Z
	where Pn is the number of tab stops	

DRAWING OR CLEARING A BOX

WYDRBX	Draw a box	CSI Ps ; Pn ; $Pn1$ p
WYCLBX	Clear a box	CSI Ps ; Pn ; $Pn1$ o

where Ps determines whether the values for the next two parameters, which specify the height (Pn) and width ($Pn1$) of the box, are based on an offset from the cursor position or on a real address:

Ps	Address Type
0	Offset (from cursor position) Pn Number of lines down from cursor position (vertical offset) $Pn1$ Number of columns to right of cursor (horizontal offset)
1	Real (line and column coordinates)
Pn	Line number of vertically opposite corner $Pn1$ Column number of horizontally opposite corner

These two commands have the same parameters for defining a rectangular area within a page: If $Ps = 0$, the box extends to the right and down from the cursor position; if $Ps = 1$, the box can extend in any direction from the cursor position. The difference between the two commands is that the WYDRBX command draws a box (border) around the specified area of the page without clearing the data within the box; the WYCLBX command clears the data in the specified area but does not draw the border around it.

- Note** Draw and clear box commands use the current erasable or nonerasable character colors and attributes.

If the box defined by Pn and $Pn1$ is larger than the page, the commands are still executed; the size of the box is just limited by the page boundaries.

Figure 8-1 illustrates two boxes in a page on which the cursor is positioned at line 5, column 43 when the commands in the following examples are sent. The first example draws a box using

an offset address to define the area of the box; the second example subsequently clears a box using a real address (line and column coordinates).

1 Sending the WYDRBX command

CSI 0 ; 9 ; 9 p

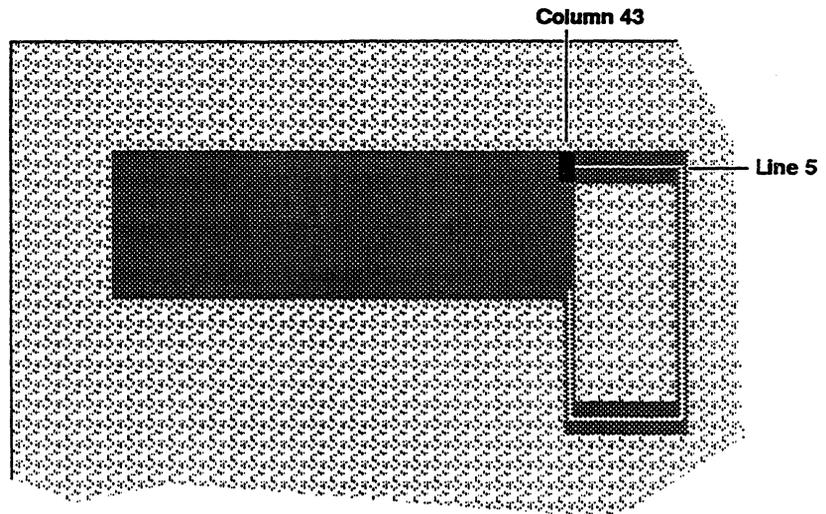

draws a rectangle that extends 9 lines down from the cursor position (from line 5 to line 14) and 9 columns to the right of the cursor (from column 43 to column 52).

2 Sending the WYCLBX command

CSI 1 ; 9 ; 9 o

clears a rectangular area 4 lines high (extending down from line 5 to line 9) and 34 columns wide (extending to the left from column 43 to column 9).

Figure 8-1 Drawing and Clearing a Box

9

Sending Data

INTRODUCTION

This chapter describes the commands for data transmission to the host and printer.

TRANSMISSION TO THE HOST OR AUXILIARY PORT

MC

Copy

CSI *Ps i*

where *Ps* is the parameter selecting the transmission function defined in Table 9-1.

Table 9-1 Transmission Functions

<i>Ps</i>	Function
0	Print page. Copies data on the current page to the printer port, inserting the commands and characters described in Table 9-2.
2	Send page. Copies data on the current page to the host port.
4	Disable controller (transparent) print. The terminal processes data received from the host port but does not send it to the printer port.
5	Enable controller (transparent) print. The terminal sends data received from the host port directly to the printer port without processing. The terminal ignores all embedded commands except copy command CSI 4 i.
6	Disable printer port receive; data received from the printer port is ignored.
7	Enable printer port receive; data received from the printer port is sent directly to the host port.

Table 9-1 Transmission Functions, Continued

<i>Ps</i>	Function
? 1	Print line. Copies data on the current line to the printer port.
? 3	Send line. Copies data on the current line to the host port.
? 4	Disable autoprint (copy print) mode. Data received from the host port is not sent to the printer port.
? 5	Enable autoprint (copy print). Each line of data received from the host port is displayed on the screen and sent to the printer port whenever the cursor moves off the line (when autowrap mode is on [DECAWM] or in response to a linefeed command [LF, FF, VT]). Each line is terminated by a carriage return (CR) plus the character that caused the cursor movement (LF is sent when autowrap occurs). The terminal executes embedded commands and does not send them to the printer port.

MC **Send host data to Aux port** **CSI 5 ; 1 i**

This control sequence sends data received from the host port directly to the port configured for an auxiliary device.

The command

CSI 4 i

(which also disables controller print mode) turns off this mode.

WYXCH **Send cursor character** **ESC 5**

This escape sequence sends the character at the cursor position to the host port.

DECTTC **Define transmission of terminator character** **CSI *Ps* ;**

where *Ps* defines whether or not to send an ASCII FF (form feed) character to the host port at the end of a send page operation

<i>Ps</i>	Termination Character
0	Do not send FF
1	Send FF

- Note** The transmission of a terminator character at the end of a print page operation is defined by the DECPFF functional mode command.

Suspending and Resuming Transmission

DC3	Suspend transmission (XOFF)	CTRL S
	When XON/XOFF handshaking is enabled, you can suspend data transmission to the host port with this control character.	
DC1	Resume transmission (XON)	CTRL Q
	When XON/XOFF handshaking is enabled and data transmission to the host port is suspended with DC3, you can resume transmission with this control character.	

Sending the Answerback Message

ENQ	Send answerback message	CTRL E
	You can send the answerback message with the ENQ control character, CTRL E. You can define the answerback message in setup mode.	

Embedded Commands and Characters Sent to Printer

The terminal inserts certain commands and characters in the data sent to the printer. These are dependent on two factors: whether 7 or 8 data bits are selected for the printer port (Data/Stop/Parity Bits parameter in setup mode), and whether *national*, *linedraw*, or *all* is selected in setup mode (Print Characters parameter).

The difference between the *national*, *linedraw*, and *all* selections determines the extent of the formatting of the data sent to the printer.

When *national* is selected, the terminal sends unformatted data from the ASCII character set only. When it encounters a special graphics character, the terminal creates an approximation of the character from the ASCII set. For example, a degree sign (°) is sent as a lowercase letter o, and some line-drawing characters are sent as plus signs (+). Softfont and control characters are sent as spaces.

When *linedraw* or *all* is selected, the terminal sends formatted data. Commands to label and assign character sets are embedded in the data stream to enable the selection of characters from different character sets.

- When *linedraw* is selected, the commands are limited to labeling character sets as font banks G0 or G1 and assigning them to GL with SI and SO switching commands.

- When *all* is selected, character sets can be labeled as any of the font banks (G0, G1, G2, and G3) and assigned to either GL or GR.

In both the *linedraw* and *all* settings, the terminal sends embedded character attribute and line attribute commands.

Table 9-2 summarizes the embedded commands sent to the printer for each Print Characters setup parameter setting.

Table 9-2 Embedded Commands Summary

Terminal Screen Data	Print Characters		
	National	Linedraw	All
Characters	Sends 7-bit ASCII characters and best ASCII representation of special graphics characters	Sends 7-bit ASCII, multinational, special graphics, and softfont characters with font bank loading information	Sends 7-bit ASCII, 8-bit multinational*, special graphics, and softfont characters with font bank loading information
Font Bank	None	Uses G0, G1, and GL font banks Sends SCS, SI, SO	Uses GL, GR, G0, G1, G2, G3 font banks Sends SCS, SI, SO, LS1R, LS2, LS2R, LS3, LS3R
Character Attributes	None	Sends all character attribute commands (Table 9-3)	Sends all character attribute commands (Table 9-3)
Line Attributes	None	Sends all line attribute commands (Table 9-4)	Sends all line attribute commands (Table 9-4)
End-of-line Terminators	Sends CRLF	Sends CRLF	Sends CRLF

* Characters sent depend on the user-preferred character set selection (Multinational Supplemental or ISO Latin-1).

Table 9-3 summarizes the control sequences sent to the printer to flag character attributes.

Table 9-3 Character Attributes Sent to Printer

Character Attribute	Control Sequence*
Normal	CSI 0 m
Blink	CSI 5 m
Bold	CSI 1 m
Reverse	CSI 7 m
Underline	CSI 4 m
Dim	CSI 2 m

* The terminal sends a single command string for multiple character attributes, separating them by semicolons (e.g., a group of bold, blinking characters would be preceded by CSI 1 ; 5 m).

Table 9-4 summarizes the escape sequences sent to the printer to flag line attributes.

Table 9-4 Line Attributes Sent to Printer

Line Attribute	Escape Sequence	Line Attribute	Escape Sequence
Single wide, single high	ESC # 5	Bottom half, double-wide, double-high	ESC # 4
Double-wide, single-high	ESC # 6	Top half, single-wide, double-high	ESC # :
Top half, double-wide, double-high	ESC # 3	Bottom half, single-wide, double-high	ESC # ;

RELATED FUNCTIONAL MODE COMMANDS

DECAWM	Autowrap mode	Set: CSI ? 7 h Reset: CSI ? 7 l
DECPEX	Print extent mode	Set: CSI ? 19 h Reset: CSI ? 19 l
DECPFF	Print form feed mode	Set: CSI ? 18 h Reset: CSI ? 18 l
SRM	Local echo disable mode	Set: CSI 12 h Reset: CSI 12 l
TTM	Transfer termination mode	Set: CSI 16 h Reset: CSI 16 l
WYGATM	Nonerasable area transmit mode	Set: CSI 37 h Reset: CSI 37 l
WYTEXM	Send full page mode	Set: CSI 38 h Reset: CSI 38 l

10 Reports

INTRODUCTION

This chapter describes the host requests and terminal responses for various terminal status reports. Also included are commands for restoring terminal states. The host can use the information in the report to save the current terminal state. The host can then restore the terminal to the saved state at any time.

DEVICE ATTRIBUTES

DA
(from host)

Request primary device attributes

CSI 0 c

In this exchange, the host requests the personality and general attributes of the terminal. The terminal's response depends on the personality selected and on the setting of the Terminal ID and Transmit Mode setup parameters. Table 10-1 lists the terminal responses.

Table 10-1 Primary Device Attribute Responses

Terminal ID	Response from Terminal to Host
VT320 (8-bit)	CSI ? 63 ; 1 ; 2 ; 6 ; 7 ; 8 ; 9 c
VT320 (7-bit)	ESC [? 63 ; 1 ; 2 ; 6 ; 7 ; 8 ; 9 c
VT220 (8-bit)	CSI ? 62 ; 1 ; 2 ; 6 ; 7 ; 8 ; 9 c
VT220 (7-bit)	ESC [? 62 ; 1 ; 2 ; 6 ; 7 ; 8 ; 9 c
VT100	ESC [? 1 ; 2 c
VT101	ESC [? 1 ; 0 c
VT102	ESC [? 6 c

DECID (from host)	Request terminal ID	ESC Z
	This escape sequence requests the terminal ID ; the responses are the same as those shown in Table 10-1 for the VT320, VT220, and VT100 terminal IDs.	
WYID (from host)	Request terminal ID	ESC SPACE 0
	This escape sequence requests the terminal ID . The response of the terminal is 370 CR	
DA (from host)	Request secondary device attributes	CSI > 0 c
	This command is a host request for the firmware revision level of the terminal. The response of the terminal is CSI > 24 ; Ps ; 0 c where <i>Ps</i> is the current firmware revision level	

DEVICE STATUS REPORTS

DSR (from host)	Request device status	CSI <i>Ps</i> n or CSI ? <i>Ps</i> n
---------------------------	------------------------------	---

where *Ps* is the status information requested

Table 10-2 lists each DSR request and the possible terminal responses.

Table 10-2 DSR Requests and Terminal Responses

Host Request	Terminal Response	Description
CSI 5 n		Terminal status?
	CSI 0 n	Terminal functioning and ready
CSI 6 n		Cursor position?
	CSI <i>Pn</i> ; <i>Pnl</i> R	Cursor is at line <i>Pn</i> , column <i>Pnl</i>
CSI ? 15 n		Printer status?
	CSI ? 10 n	Printer is ready ¹
	CSI ? 11 n	Printer is not ready ²
	CSI ? 13 n	No printer is associated to the active session

1. This is always the response if the printer associated to the active session is a *serial* printer.
 2. Response applies only to a parallel printer connected to an installed cartridge.
-

Table 10-2 DSR Requests and Terminal Responses, Continued

Host Request	Terminal Response	Description
CSI ? 25 n		Function key definitions locked?
	CSI ? 20 n	Function key definitions are not locked
	CSI ? 21 n	Function key definitions are locked.
CSI ? 26 n	CSI ? 27 ; Ps n	Current keyboard language?
		Current keyboard language is
		<i>Ps</i> Language
		1 US ³
		2 British
		3 Belgian
		4 French Canadian ³
		5 Danish
		6 Finnish
		7 German
		8 Dutch
		9 Italian
		10 Swiss (French)
		11 Swiss (German)
		12 Swedish
		13 Norwegian
		14 French
15 Spanish		
16 Portuguese		
30 Latin American ³		
<p>3. Only the US, French Canadian, and Latin American keyboard languages are supported by the North American model of the terminal.</p>		

TERMINAL STATE REPORT

The host can request (DECQRQTSR) a report on the terminal's current operating state. In response, the terminal sends a detailed device control string (DECTSR) reporting the current settings of all the main functions and modes. This report can be stored in program memory and the settings restored later by the host (DECRRSTS).

DECQRQTSR
(from host)

Request terminal state

CSI 1 \$ u

This control sequence requests the current operating state of the terminal.

DECTSR **Report terminal state** **DCS 1 \$ s ds...ds c1 c2 ST**
(to host)

where *ds...ds* is a data string of up to 200 characters that encodes the information on the current operating state of the terminal. (This string is Wyse proprietary.)

c1 and *c2* are checksums.

ST is the string terminator.

DECRSTS **Restore terminal state** **DCS 1 \$ p ds...ds c1 c2 ST**
(from host)

where *ds...ds* is the stored data string of up to 200 characters that encodes the information necessary for the host to restore the previously reported operating state of the terminal (same as DECTSR).

c1 and *c2* are checksums.

ST is the string terminator.

This command restores the terminal operating state reported to the host with the DECTSR control sequence.

Note The command is ignored if received by the inactive session.

CURSOR AND TAB STOP REPORTS

The host can request a report containing cursor or tab stop information. The terminal's report can be saved in program memory to be restored later by the host. This is useful, for example, if your application needs to temporarily change cursor or tab stop positions.

See the "Tab Stop Report" section for examples of these operations.

DECRQPSR **Request cursor or tab stop report** **CSI Ps \$ w**
(from host)

where *Ps* identifies whether cursor or tab stop information is requested

<i>Ps</i>	Request
1	Cursor information
2	Tab stop information

In response, the terminal sends a cursor information report (DECCIR) or a tab stop report (DECTABSR).

Cursor Information Report
**DECCIR
(to host)**
Report cursor information
DCS 1 \$ u ds...ds ST

where *ds...ds* is the data string of encoded terminal response (Rs) bits. The format of the data string is

Rs ; Rs1 ; Rs2 ; Rs3 ; Rs4 ; Rs5 ; Rs6 ; Rs7 ; Rs8 ; Rs9

Rs Cursor line number (offset by the top scroll margin if DECOM is reset)

Rs1 Cursor column number

Rs2 Current page number

Rs3 Current display attributes:

@	=	Normal
A	=	Bold
B	=	Underline
C	=	Bold/underline
D	=	Blinking
E	=	Blinking/bold
F	=	Blinking/underline
G	=	Blinking/underline/bold
H	=	Reverse
I	=	Reverse/bold
J	=	Reverse/underline
K	=	Reverse/bold/underline
L	=	Reverse/blinking
M	=	Reverse/blinking/bold
N	=	Reverse/blinking/underline
O	=	Reverse/blinking/bold/underline
P	=	Blank
Q	=	Bold/blank
R	=	Underline/blank
S	=	Bold/underline/blank
T	=	Blinking/blank
U	=	Blinking/bold/blank
V	=	Blinking/underline/blank
W	=	Blinking/underline/bold/blank
X	=	Reverse/blank
Y	=	Reverse/bold/blank
Z	=	Reverse/underline/blank
[=	Reverse/bold/underline/blank
\	=	Reverse/blinking/blank
]	=	Reverse/blinking/bold/blank
^	=	Reverse/blinking/underline/blank
_	=	Reverse/blinking/bold/underline/blank

Rs4 Current selective erase attributes

@ = None
A = Selective erase

Rs5 Flags

bit 7 = Always 0
bit 6 = Always 1
bit 5 = Always 0
bit 4 = Always 0
bit 3 = 1 if autowrap mode (DECAWM) is reset
bit 2 = 1 if G3 is assigned to GL for next character only
bit 1 = 1 if G2 is assigned to GL for next character only
bit 0 = 1 if DECOM (origin mode) is set

Rs6 Current character set assigned to GL

0 = G0 is assigned to GL
1 = G1 is assigned to GL
2 = G2 is assigned to GL
3 = G3 is assigned to GL

Rs7 Current character set assigned to GR

0 = G0 is assigned to GR
1 = G1 is assigned to GR
2 = G2 is assigned to GR
3 = G3 is assigned to GR

Rs8 Character set size

bit 7 = Always 0
bit 6 = Always 1
bit 5 = Always 0
bit 4 = Always 0
bit 3 = G3 character set size (0 = 94; 1 = 96)
bit 2 = G2 character set size (0 = 94; 1 = 96)
bit 1 = G1 character set size (0 = 94; 1 = 96)
bit 0 = G0 character set size (0 = 94; 1 = 96)

Rs9 String indicating which character sets are labeled as G0, G1, G2, and G3

If multinational mode is on:

B = ASCII
% 5 = Multinational Supplemental
A = ISO Latin-1 Supplemental
< = User-preferred supplemental (Multinational or ISO Latin-1 as defined by DECAUPSS or in setup mode)
0 = Special Graphics
name = One-, two-, or three-character name assigned to softfont character set in DECDLD softfont load command

If national mode is on:

A = UK
 4 = Dutch
 C = Finnish
 R = French/Belgian
 Q = French Canadian
 K = German
 Y = Italian
 E = Norwegian/Danish
 Z = Spanish
 H = Swedish
 = = Swiss
 X = Latin American Spanish
 %6 = Portuguese
 B = ASCII
 0 = Special Graphics
 name = One-, two-, or three-character name assigned to softfont character set in DECDLD softfont load command

Examples of *Rs9* Strings

The *Rs9* string

B B < <

reports the terminal's default character set labeling configuration: ASCII labeled as both G0 and G1; the user-defined supplemental set labeled as both G2 and G3.

The *Rs9* string

B % 5 \$ \$ 0 <

reports the following character set labels: ASCII labeled as G0; Multinational Supplemental labeled as G1; a softfont character set named \$ \$ 0 (as entered in the DECDLD softfont load command) labeled as G2; and the user-preferred supplemental character set labeled as G3.

DECRSPS
(from host)

Restore cursor information

DCS 1 \$ t *ds...ds* ST

where *ds...ds* is the data string that describes the current cursor information to be restored (same data string as described in DECCIR)

ST is the string terminator.

Tab Stop Report
DECTABSR
 (to host)

Report tab stop information
DCS 2 \$ u *ds...ds* ST

where *ds...ds* is a data string identifying the column number where each tab stop is located, separated by slashes (/)

For example, if the terminal had tab stops set at columns 6, 11, 16, and 21, the DECTABSR sequence would be

DCS 2 \$ u 6 / 11 / 16 / 21 ST
DECRSPS
 (from host)

Restore tab stop information
DCS 2 \$ t *ds...ds* ST

where *ds...ds* is the data string that contains the coded information necessary to restore the tab stops (same data string as DECTABSR)

ST is the string terminator.

Examples

You can use the tab stop request and restore commands as a nondestructive method of setting tab stops in your application program. For example, if your application requires tab stops at columns 10, 20, 30, 40, 50, 60, and 70,

- 1 Send the host request (DECQRPSR)

CSI 2 \$ w

- 2 Store the received terminal report (DECTABSR) in host memory

- 3 Format and send the restore command (DECRSPS), listing the tab stops for your application

DCS 2 \$ t 10 / 20 / 30 / 40 / 50 / 60 / 70 ST

- 4 Send the restore command again, listing the values stored in host memory in step 2

As you can see from step 3 in the above example, you could also use the restore command by itself as a quick way to clear and set tab stops instead of using tab stop clearing and setting commands along with cursor movement commands.

CONTROL FUNCTION REPORTS

DECRQSS **Request control function selection or setting** **DCS \$ q Ps ST**
(from host)

where *Ps* is the parameter identifying the control function

<i>Ps</i>	Control Function	Mnemonic
\$ }	Data destination	DECSASD
" q	Erase attributes	DECSCA
" p	Personality	DECSCCL
\$ ~	Status line type	DECSSDT
r	Top and bottom margins	DECSTBM
m	Character attributes	SGR

ST is the string terminator.

This command can request information on only one control function at a time.

DECRPSS **Report control function selection** **DCS Ps \$ r ds...ds PsI ST**
(to host) **or setting**

where *Ps* is the parameter that indicates request validity

<i>Ps</i>	Request Validity
0	Host request is invalid
1	Host request is valid

PsI is the parameter identifying the control function (same as DECRQSS)

ds...ds is a data string that reports the current setting of the control function.

Current setting response format:

DECSASD (\$)}	Data Destination
<i>ds</i> = 0	Data destination is main display
<i>ds</i> = 1	Data destination is host-writable status line
DECSCA ("q)	Erase Attributes
<i>ds</i> = 0	Off
<i>ds</i> = 1	On
DECSCCL ("p)	Personality ID
<i>ds</i> = 63 ; 1	Native or VT320/VT220, 7-bit
<i>ds</i> = 63 ; 2	Native or VT320/VT220, 8-bit
DECSSDT (\$~)	Status Line Type
<i>ds</i> = 0	No status line
<i>ds</i> = 1	Terminal message
<i>ds</i> = 2	Terminal message and host-writable

DECSTBM (r)	Top and Bottom Margins
<i>ds1</i> =	Top line of scroll region
<i>ds2</i> =	Bottom line of scroll region
SGR (m)	Character Attributes
<i>ds*</i> = 0	Normal
1	Bold
2	Dim
4	Underline
5	Blinking
7	Reverse
8	Blank
9	Overstrike
30	Black foreground
31	Red foreground
32	Green foreground
33	Yellow foreground
34	Blue foreground
35	Magenta foreground
36	Cyan foreground
37	White foreground
40	Black background
41	Red background
42	Green background
43	Yellow background
44	Blue background
45	Magenta background
46	Cyan background
47	White background

* If more than one attribute is active, *ds* data is separated by semicolons.

ST is the string terminator.

The following are examples of typical control function reports:

DCS 1 \$ r 63 ; 1 " p ST

The current terminal personality is native or VT320/VT220,
7-bit

DCS 1 \$ r 0 \$ } ST

Data is written to the main display

DCS 1 \$ r 1 ; 5 ; 7 m ST

Current character attributes are bold, blinking, and reverse

FUNCTIONAL MODE REPORTS

DECRQM Request functional mode status (1) CSI *Ps* \$ p
 (from host) (2) CSI ? *Ps* \$ p

where *Ps* is the parameter representing the functional mode for which status is requested

(1) <i>Ps</i>	Mode	Mnemonic
2	Keyboard lock	KAM
3	Monitor mode	CRM
4	Insert/replace	IRM
10	Horizontal editing	HEM*
12	Local echo disable	SRM
20	Newline	LMN

* Mode is permanently reset.

(2) <i>Ps</i>	Mode	Mnemonic
1	Cursor key application	DECCKM
2	ANSI/VT52	DECANM
3	132 column	DECCOLM
4	Scrolling	DECSCLM
5	Reverse screen	DECSNM
6	Origin	DECOM
7	Autowrap	DECAWM
8	Key autorepeat	DECARM
18	Print form feed	DECPFF
19	Print extent	DECPFX
25	Text cursor enable	DECTCEM
42	National replacement character set	DECNRCM
66	Keypad application	DECNKM
67	Delete key	DECBKM
68	Key legend	DECKBUM

DECRPM Report functional mode status (1) CSI *Ps* ; *PsI* \$ y
 (to host) (2) CSI ? *Ps* ; *PsI* \$ y

where (1) *Ps* is the same mode identified in the DECRQM (1) request

(2) *Ps* is the same mode identified in the DECRQM (2) request

PsI is the parameter for the mode setting

<i>PsI</i>	Mode Setting
0	Unrecognized mode
1	Mode is set
2	Mode is reset
3	Mode is permanently set
4	Mode is permanently reset

ANSI Character Sets

DEC = decimal, HEX = hexadecimal; read across and then down.

ISO Latin-1 Supplemental

NATIONAL REPLACEMENT CHARACTER SETS

When the terminal is in national mode (DECNRCM) the ASCII character set is modified by certain national replacement characters according to the keyboard language selected in setup mode. The character set illustrations in this section show the NRC characters (shaded) for each keyboard language.

- Note** Only the French Canadian and Latin American Spanish NRC sets are supported by the North American model.

CONTROLS DISPLAY MODE

When the Controls setup parameter is set to *display*, the terminal displays received codes instead of executing them. This is useful for debugging programs. In controls display mode, the terminal displays symbolic representations of the C0 and C1 control characters.

The following illustrations show the characters displayed in controls display mode.

DEC	0	16	32	48	64	80	96	112

Local Keyboard Commands

Table C-1 Native Personality Local Keyboard Commands

Command	Keyboard Style		
	105-Key ANSI	ASCII	Enhanced PC
Turn CAPS LOCK on/off	Lock	Caps Lock	Caps Lock
Turn NUM LOCK on/off			Num Lock
Turn keyclick on/off	Ctrl Enter	Ctrl Enter	Ctrl Enter <i>kpd</i>
Hold data on screen	F1 OR Compose Character ¹	Funct ¹	Scroll Lock OR Alt <i>left</i> ¹
Print page	F2	Print	Print Screen
Enter or exit setup mode	F3	Setup	Select
Enter or exit WyseWorks mode	Ctrl F3 OR Ctrl Lock	Ctrl Setup OR Ctrl Caps Lock	Ctrl Select OR Ctrl Caps Lock
Perform hard terminal reset ²	Ctrl Shift F3	Ctrl Shift Break	Ctrl Shift Select
Perform terminal mode reset ³	Shift F3	Shift Setup	Shift Select
Send break to host port	F5	Break	Break
Transmit answerback message	Ctrl Shift F5	Send	Ctrl Shift End
Lower RTS line on the host port for two seconds	Ctrl F5		Pause
Toggle block/full-duplex modes	Shift F5	Shift Break	Shift Break
Turn autoprint mode on/off	Ctrl Shift F2	Ctrl Print	Shift Sys Rq
Turn controls mode on/off	Ctrl Shift 1 <i>kpd</i>	Ctrl Shift 1 <i>kpd</i>	Ctrl Shift 1 <i>kpd</i>

1. When Corner Key setup parameter is set to *hold* and XON/XOFF handshaking is enabled for the host port.
2. See the "Resetting and Testing the Terminal" section of Table F-1 for the functions performed by the terminal.
3. See the "Resetting and Testing the Terminal" section of Table F-1 for the functions performed by the terminal. If command is executed *during* a print or send operation, the terminal aborts the print/send operation. The command must be executed again for the terminal to perform the terminal mode reset.

Table C-1 Native Personality Local Keyboard Commands, Continued

Command	Keyboard Style		
	105-Key ANSI	ASCII	Enhanced PC
Turn trace mode on/off	Ctrl Shift 9 <i>kpd</i>	Ctrl Shift 9 <i>kpd</i>	Ctrl Shift 9 <i>kpd</i>
Turn instant screen saver on ⁴	Ctrl Remove	Ctrl Clr Scm	Ctrl Del <i>kpd</i>
Change status line display (user, system, off)	Ctrl ▶	Ctrl ▶	Ctrl →
Increase scrolling rate	Ctrl Shift ▲	Ctrl Shift ▲	Ctrl Shift ↑
Decrease scrolling rate	Ctrl Shift ▼	Ctrl Shift ▼	Ctrl Shift ↓
Home cursor and clear page ⁵	Ctrl Prev Scm	Ctrl Shift Home	Ctrl Shift Home
Display next page	Ctrl Shift Next Scm	Ctrl Next Page	Ctrl Page Down
Display previous page	Ctrl Shift Prev Scm	Ctrl Prev Page	Ctrl Page Up
Activate other session	F4	Ctrl Shift Setup	Ctrl End
Select dual-session screen format	Ctrl F4	Ctrl Shift - <i>kpd</i>	Ctrl Shift - <i>kpd</i>
Activate other window ⁶	Ctrl Shift F4	Ctrl Shift . <i>kpd</i>	Ctrl Shift + <i>kpd</i>
Move split point left (vertical split) or up (horizontal split)	Ctrl - <i>kpd</i>	Ctrl - <i>kpd</i>	Ctrl - <i>kpd</i>
Move split point right (vertical split) or down (horizontal split)	Ctrl Shift . <i>kpd</i>	Ctrl Shift . <i>kpd</i>	Ctrl Shift + <i>kpd</i>
Toggle to other set of user-defined keys, if both are attached to active session	Ctrl Select	Ctrl Home	Ctrl Home

4. Screen Saver parameter must not be set to *off*.

5. Page is cleared to space characters displayed with the current replacement character color and attributes.

6. Command is effective whether the windows are displaying two sessions or two pages from the same session.

Table C-2 Local Keyboard Commands Supported in ASCII Personalities

Command	Keyboard Style		
	105-Key ANSI	ASCII	Enhanced PC
Turn CAPS LOCK on/off	Lock	Caps Lock	Caps Lock
Turn NUM LOCK on/off			Num Lock
Turn keyclick on/off	Ctrl Enter	Ctrl Enter	Ctrl Enter <i>kpd</i>
Hold data on screen	F1 OR Compose Character ¹	Func ¹	Scroll Lock OR Alt <i>left</i> ¹
Send function sequence	Compose Character ²	Func ²	Alt <i>left</i> ²
Enter or exit setup mode	F3	Setup	Select
Enter or exit WyseWorks mode	Ctrl F3 OR Ctrl Lock	Ctrl Setup OR Ctrl Caps Lock	Ctrl Select OR Ctrl Caps Lock
Perform hard terminal reset ³	Ctrl Shift F3	Ctrl Shift Break	Ctrl Shift Select
Perform soft terminal reset ³	Shift F3	Shift Setup	Shift Select
Send break to host port	F5	Break	Break
Toggle block/full-duplex modes	Shift F5	Shift Break	Shift Break
Turn auxiliary print mode on/off	Ctrl Shift F2	Ctrl Print	Shift Sys Rq
Turn controls mode on/off	Ctrl Shift 1 <i>kpd</i>	Ctrl Shift 1 <i>kpd</i>	Ctrl Shift 1 <i>kpd</i>
Turn trace mode on/off	Ctrl Shift 9 <i>kpd</i>	Ctrl Shift 9 <i>kpd</i>	Ctrl Shift 9 <i>kpd</i>
Turn on instant screen saver ⁴	Ctrl Remove	Ctrl Ctr Scm	Ctrl Del <i>kpd</i>
Change status line display (user, system, off)	Ctrl ►	Ctrl ►	Ctrl →
Increase scrolling rate	Ctrl Shift ▲	Ctrl Shift ▲	Ctrl Shift ↑
Decrease scrolling rate	Ctrl Shift ▼	Ctrl Shift ▼	Ctrl Shift ↓
Home cursor and clear page ⁵	Ctrl Prev Scrn	Ctrl Shift Home	Ctrl Shift Home
Activate other session	F4	Ctrl Shift Setup	Ctrl End
Select dual-session screen format	Ctrl F4	Ctrl Shift - <i>kpd</i>	Ctrl Shift - <i>kpd</i>
Activate other window ⁶	Ctrl Shift F4	Ctrl Shift . <i>kpd</i>	Ctrl Shift + <i>kpd</i>

1. When Corner Key setup parameter is set to *hold* and XON/XOFF handshaking is enabled for the host port.
2. When Corner Key setup parameter is set to *fnct* and key is pressed together with an alphanumeric key, this command sends an ASCII SOH character, the other key's code, and an ASCII CR character.
3. A hard reset is equivalent to turning the terminal off and on again. A soft reset unlocks the keyboard, turns off all print modes, and resets communications (UART).
4. Screen Saver parameter must not be set to *off*.
5. Page is cleared to nulls in background color.
6. Command is effective whether the windows are displaying two sessions or two pages from the same session.

Table C-2 Local Keyboard Commands Supported in ASCII Personalities, Continued

Command	Keyboard Style		
	105-Key ANSI	ASCII	Enhanced PC
Move split point left (vertical split) or up (horizontal split)	Ctrl [-] kpd	Ctrl [-] kpd	Ctrl [-] kpd
Move split point right (vertical split) or down (horizontal split)	Ctrl [.] kpd	Ctrl [.] kpd	Ctrl [+] kpd
Toggle to other set of user-defined keys, if both are attached to active session	Ctrl [Select]	Ctrl [Home]	Ctrl [Home]

Table C-3 Color Palette Commands (ASCII Personalities)¹

Command	Key ²
Select amber color palette	Ctrl [0]
Select green color palette	Ctrl [1]
Select white color palette	Ctrl [2]
Select cyan color palette	Ctrl [3]
Select light purple color palette	Ctrl [4]
Select yellow color palette	Ctrl [5]
Select sky blue color palette	Ctrl [6]
Select light gray color palette	Ctrl [7]
Select light green color palette	Ctrl [8]
Select cream color palette	Ctrl [9]

1. If a palette is changed in Esprit III personality at a time when non-Esprit attributes remain on the screen, only the non-Esprit attributes change color.
2. Number keys are located on the numeric keypad.

Table C-4 Local Keyboard Commands Supported in TEK 4010/4014 Personality

Command	Keyboard Style		
	105-Key ANSI	ASCII	Enhanced PC
Turn CAPS LOCK on/off	Lock	Caps Lock	Caps Lock
Turn NUM LOCK on/off			Num Lock

E Control Codes

Tables E-1 and E-2 list the control codes supported in the terminal's native personality. Table E-3 lists the control codes supported in ASCII personalities.

Table E-1 Native Personality 7-Bit Control Codes (C0)¹

C0 Character	Symbol ² 74 Hz	60 Hz ³	Control Key ⁴	Decimal Value	Hex Value	Action ⁵
NUL			@ or Spacebar	000	00	
SOH	S _H	S _H	A	001	01	
STX	S _X	S _X	B	002	02	
ETX	E _X	E _X	C	003	03	
EOT	E _T	E _T	D	004	04	
ENQ	E _Q	E _Q	E	005	05	Send answerback message
ACK	A _K	A _K	F	006	06	
BEL	B _L	B _L	G	007	07	Sound bell, if enabled
BS	B _S	B _S	H	008	08	Cursor left (backspace)
HT	H _T	H _T	I	009	09	Tab cursor
LF	L _F	L _F	J	010	0A	Cursor down (linefeed)
VT	V _T	V _T	K	011	0B	Same as LF
FF	F _F	F _F	L	012	0C	Same as LF
CR	C _R	C _R	M	013	0D	Cursor to start of line
SO	S _O	S _O	N	014	0E	Load G1 character set into GL (LS1)
SI	S _I	S _I	O	015	0F	Load G0 character set into GL (LS0)
DLE	D _L	J	P	016	10	

- Codes also supported in VT320/VT220, VT100, VT52, and Intecolor personalities.
- Characters displayed when Controls Mode setup parameter is set to *display*. 74 Hz (16x16 character cell size) and 60 Hz (16x20 character cell size) refer to the screen resolution selected by the Screen Resolution setup parameter.
- Refers only to 24/25x80 screen size. All other screen formats display the characters shown in the 74 Hz column.
- Key pressed with **Ctrl**. Can be shifted or unshifted.
- A blank in this column means the code is ignored.

RS		[~] ⁵ or [^] ⁵	030	1E	Home cursor
US	⌘	[_] ⁵	031	1F	Cursor to start of next line

5. Shifted key only.

F

ANSI Command Summary

Table F-1 lists the commands supported by the terminal in the native personality and in VT320/VT220, VT100, and Intecolor 220 personalities. Mnemonics beginning with WY are Wyse private mnemonics; those beginning with DEC are Digital Equipment Corporation private mnemonics; all others are ANSI mnemonics.

- **Note** The terminal does not support the VT100 CSI q (change the LEDS) command.

Command sequences and terminal report responses are shown in 8-bit format, which is recognized in the native, VT320/VT220, and Intecolor personalities. The following 7-bit equivalents for the 8-bit C1 control characters are recognized in all ANSI personalities.

8-Bit Control Character	7-Bit Equivalent
IND	ESC D
NEL	ESC E
HTS	ESC H
RI	ESC M
SS2	ESC N
SS3	ESC O
DCS	ESC P
CSI	ESC [
ST	ESC \
OSC	ESC]
PM	ESC ^
APC	ESC _

Within a command sequence, parameters are shown in italics. *P_n* represents a numerical parameter; *P_s* represents a selective parameter. Parameter values are listed immediately following the command.

Table F-2 lists the commands supported by the terminal in VT52 personality.

Table F-1 Commands Supported in ANSI Personalities

Command	Command Sequence			VT100	Mnemonic
	Native	VT320/220 Intecolor			
Controlling Terminal Modes					
Terminal modes on (set)	(1) CSI <i>Ps</i> ; ; ; ; ; <i>Ps</i> h	Same	Same	SM

			80 161 column ¹⁰	WY161	NVR
			83 52 line ¹⁰	WY52	NVR
			84 Erasable/nonerasable attribute select ¹¹	WYENAT	Off
			85 Replacement character color ¹⁰	WYREPL	Off

- Final character in sequence is a lowercase L.
- Ps* values are listed in two groups: In the first group are the values for terminal modes that can be set with SM command sequence (1) or reset with RM command sequence (1); in the second group are the values for terminal modes that can be set with SM sequence (2) or reset with RM sequence (2). The latter group is shown as ? *Ps* to indicate that sequence (2) includes a question mark immediately following the control sequence introducer CSI. Up to 16 *Ps* values can be specified (separated by semicolons) in any one SM or RM command sequence.
- Mode status when terminal is turned on or reset. "NVR" (nonvolatile RAM) means that the status depends on the value last saved in battery-backed memory in setup mode.
- Return setup parameter (Keyboard menu, Key Functions submenu).
- Set mode (SM) only.
- Reset mode (RM) only.
- Command is ignored during dual-session operation with a vertically split screen.
- Set mode (SM) only. Command is ignored if the terminal is set up for two sessions.
- Command is ignored if Keyboard Language parameter is set to U.S.
- Native and VT320/VT220 personalities only.
- Native personality only. Enables separate assignment of attributes to erasable and nonerasable characters (by the SGR command); when reset, attributes extend to both.

Table F-1 Commands Supported in ANSI Personalities, Continued

Command	Command Sequence			
	Native	VT320/220 Intecolor	VT100	Mnemonic
Save cursor position, attributes, character sets, wrap flag, and origin mode	ESC 7 or CSI s	Same	Same	DECSC WYSC
Delay processing about 250 ms	ESC ,	Same	Same	WYDELAY
Restore last saved cursor position, attributes, character sets, wrap flag, origin mode, and single-shift status	ESC 8 or CSI u	Same	Same	DECRC WYRC
Block mode on	CSI ? 10 h	Same	Same	DECEDM
Block mode off	CSI ? 10 l	Same	Same	DECEDM
Sound bell, if enabled	CTRL G	Same	Same	BEL
Set date and time ¹²	CSI 58 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> ; <i>Ps3</i> ; <i>Ps4</i> w			WYDTSET
	<i>Ps</i> Day (1-31) <i>Ps1</i> Month (1-12) <i>Ps2</i> Year (0-99)	<i>Ps3</i> Hour (1-24) <i>Ps4</i> Minutes (0-59)		
Abort escape sequence	CTRL X	Same	Same	CAN
Abort escape sequence; display reverse question mark	CTRL Z	Same	Same	SUB
Ignore all subsequent data until ST (or ESC \) received	ESC] or ESC ^ or ESC _	Same		OSC PM APC
Controlling the Screen Display				
Controls mode on	CSI 3 h	Same	Same	CRM
Controls mode off	CSI 3 l	Same	Same	CRM
Control execution off	CSI 13 h	Same	Same	FEAM
Control execution on	CSI 13 l	Same	Same	FEAM
Display disable (blank screen)	CSI 30 h	Same	Same	WYDSCM
Display screen	CSI 30 l	Same	Same	WYDSCM
Status line display	CSI 31 h	Same	Same	WYSTLINM
Blank status line	CSI 31 l	Same	Same	WYSTLINM
Screen saver on	CSI 32 h	Same	Same	WYCRTSAVM

12. Date alone can be set by including parameters *Ps* ; *Ps1* ; and *Ps2* only. Time alone can be set by CSI 58 ; ; ; ; *Ps3* ; *Ps4* w.

	Z Spanish ²¹				
	H or 7 Swedish ²¹				
	= Swiss ²¹				
	X Latin American Spanish				
	%6 Portuguese ²¹				

16. Command is ignored if the terminal is set up for two sessions.

17. See Appendix A for character set illustrations.

18. 96-character set only. Not available in VT100 personality.

19. Multinational (default) or ISO Latin-1 as defined by DECAUPSS or in setup mode. (VT100 personality supports only Multinational.)

20. Valid only when national replacement character mode is set and when Keyboard Language setup parameter is set to the corresponding language. Only one set is available at a time.

21. Available only if the language is supported in an installed cartridge.

Table F-1 Commands Supported in ANSI Personalities, Continued

Command	Command Sequence		VT320/220 Intecolor	VT100	Mnemonic

Assign G3 character set to GL for the next character only	ESC O		Same		SS3
Loading Softfonts					
Load soft character font ²²	DCS <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> ; <i>Ps3</i> ; <i>Ps4</i> ; <i>Ps5</i> ; <i>Ps6</i> ; <i>Ps7</i> { <i>name Sxhp</i> ; ... ; <i>Sxhp</i> ST		Same		DECDDL
<i>Ps</i>	Font number (0 or 1)				
<i>Ps1</i>	Initial Character Position A decimal number identifying the position of the initial character to be loaded. Character positions are numbered consecutively starting with 1 = 21H for a 94-character set or 0 = 20H for a 96-character set (i.e., position 20H is not available for a 94-character set).				
<i>Ps2</i>	Erase Control				
0	Erase all characters in the set before redefining (default)				
1	Erase each character as it is redefined				
2	Erase all characters in both 80- and 132-column sets				

22. Command is ignored when a 16x20 character cell and 26-line by 80-column screen is selected. This screen size supports a total of only 256 displayable characters.

Table F-1 Commands Supported in ANSI Personalities, Continued

Command	Command Sequence		Mnemonic
	Native	VT320/220 Intecolor	
<i>Ps3</i> ²³	Character Matrix Width²⁴		<i>Ps3</i> ²³
0	16 pixels wide in 80-column mode (default)	8	8 pixels wide
	10 pixels wide in 132-column mode	9	9 pixels wide
	8 pixels wide in 161-column mode	10	10 pixels wide
1	Illegal	11	11 pixels wide
2	5 pixels wide	12	12 pixels wide
3	6 pixels wide	13	13 pixels wide
4	7 pixels wide	14	14 pixels wide
5	5 pixels wide	15	15 pixels wide
6	6 pixels wide	16	16 pixels wide
7	7 pixels wide		
<i>Ps4</i>	Font Width		
0 or 1	80-column (default)		
2	132- or 161-column display		
<i>Ps5</i>	Font Type²⁵		
0 or 1	Text (default)		
2	Full cell		
<i>Ps6</i>	Cell Height	<i>Ps6</i>	Cell Height
0	16 pixels (default)	7	7 pixels
1	1 pixel	8	8 pixels
2	2 pixels	9	9 pixels
3	3 pixels	10	10 pixels
4	4 pixels	11	11 pixels
5	5 pixels	12	12 pixels
6	6 pixels		
<i>Ps7</i>	Character Set Size		
0	94-character set (default)		
1	96-character set		
{	A separator		
<i>name</i>	A one-, two-, or three-character name assigned to the softfont character set and referenced when labeling the set (SCS).		
	First character (optional):	ASCII character from SP to / (20H-2FH)	
	Second character (optional):	ASCII character from SP to / (20H-2FH)	
	Third character (required):	ASCII character from 0 to ~ (30H-7EH)	
<i>Sxbp</i>	The sixel bit pattern defining the character loaded. Up to 94 or 96 individual character bit patterns (separated by semicolons) may be specified, depending on character set size (<i>Ps7</i> parameter setting).		
ST	String terminator		

23. In native personality, the *Ps3* parameter value overrides the sixel patterns that are specified. For example, if *Ps3* = 5, only the first five *Sxbp* values are recognized.

24. Select *Ps3* values of 2 or 3 to load characters already designed for a DEC VT220 10x10 cell.

25. If a full-cell font is selected, all pixels in the cell can be individually addressed. If a text font is selected, the terminal automatically provides character spacing by blanking the first two and the last two columns of the cell.

Table F-1 Commands Supported in ANSI Personalities, Continued

Command	Command Sequence				Mnemonic
	Native	VT320/220 Intecolor	VT100

Define top half of double-high, single-wide line	ESC # :	Same	Same	WYDHL
Define bottom half of double-high, single-wide line	ESC # ;	Same	Same	WYDHL

Defining Color Associations

Redefine character display attribute association

CSI *Ps* ; *Ps1* ;
Ps2 ; *Ps3* w

WYCAA

Ps A value from 0 to 47 specifying the existing attribute association (blank, blink, reverse, underline) to be redefined for a given base character attribute (normal, dim, or bold)

Attribute Association	Base Character Attribute		
	Normal <i>Ps</i>	Dim <i>Ps</i>	Bold <i>Ps</i>
Normal (no attributes)	0	16	32
Blank	1	17	33
Blink	2	18	34
Blink and blank	3	19	35
Reverse	4	20	36
Reverse and blank	5	21	37
Reverse and blink	6	22	38
Reverse, blink, and blank	7	23	39
Underline	8	24	40
Underline and blank	9	25	41
Underline and blink	10	26	42
Underline, blank, and blink	11	27	43
Underline and reverse	12	28	44
Underline, blank, and reverse	13	29	45
Underline, blink, and reverse	14	30	46
Underline, blank, blink, and reverse	15	31	47

Ps1 A value from 0 to 64 specifying the new foreground color (see Color Table)

Ps2 A value from 0 to 64 specifying the new background color (see Color Table)

Color Table²⁷

Value	Color	Value	Color	Value	Color
0	Default (NVR)	4	Blue	8	Bright blue
1	Black	5	Grass green	9	Bright green
2	Dark blue	6	Teal blue	10	Light blue-green
3	Deep blue	7	Electric blue	11	Turquoise

27. Color names are for convenience of reference and are not based on any scientific or artistic criteria. The names are intended only as guidelines within a range of colors.

40. *ds...ds* is a data string that reports the current setting of the control function.

Table F-1 Commands Supported in ANSI Personalities, Continued

Command	Command Sequence			Mnemonic
	Native	VT320/220 Intecolor	VT100	
Resetting and Testing the Terminal				
Display screen adjustment pattern	ESC # 8	Same	Same	DECALN
Soft terminal reset ⁴¹	CSI ! p	Same		DECSTR
Hard terminal reset ⁴²	ESC c	Same		RIS
Terminal mode reset ⁴³	ESC ! p	Same	Same	WYSTR

41 Performs the following functions:

Turns cursor on (if off)
 Resets insert mode
 Resets origin mode
 Resets autowrap mode
 Resets keyboard lock mode
 Resets keypad application mode
 Resets cursor key application mode
 Clears block mode (sets to on-line)
 Clears scrolling region
 Resets G0, G1, G2, G3, GL, and GR to defaults
 Resets character attributes to normal
 Resets selective erase attribute to erasable
 Resets save cursor state to default
 Resets national replacement character set to Multinational
 Resets user-preferred character sets to value last saved in setup mode
 Resets data destination to screen data area

42 Performs the following functions in addition to all the functions of a soft terminal reset:

Performs communication line disconnect, reconnect
 Restores all setup mode parameter settings to values last saved
 Restores tab stops, answerback message, and function key definitions to values last saved in setup mode
 Clears softfonts
 Clears screen
 Homes cursor
 Turns on display, if off
 Clears CAPS LOCK mode to value last saved
 Clears Xoff receive state on data communications port
 Clears Xoff receive state on printer port
 Clears handshake state, raises DTR if low, and sends Xon if XON/XOFF handshaking is enabled

43 Performs the following functions:

Turns on display, if off
 Clears block mode (sets to on-line)
 Resets insert mode
 Clears function key lock
 Resets cursor key application mode
 Resets keyboard action mode
 Resets keypad application mode
 Clears the Xoff receive state on the host port
 Clears the Xoff receive state on the printer port
 Resets G0, G1, G2, G3, GL, and GR to their default selections
 Clears handshake state, raises DTR if low, and sends Xon if XON/XOFF handshaking is enabled

Programming in Wyse 350 Personality

INTRODUCTION

Programs written for the WY-350 terminal will run without modification in Wyse 350 personality. In addition, you can take advantage of the following enhanced features

- Additional user-definable keys
- Programmable key direction
- Multiple pages and sessions
- Host-selectable personalities
- Enhanced international support
- 161-column display
- Commands controlling end-of-line wrap, autopage, printer receive, transparent print, and bidirectional modes

Command Descriptions

The description of the commands that control the terminal in Wyse 350 personality are grouped by function in the body of the appendix. Near the end of the appendix, in the section entitled "ASCII Command Summary," Table G-6 lists all commands supported by the terminal in all its ASCII personalities, including Wyse 350.

Conventions and Syntax Notation

Control codes are shown with the notation *CTRL* indicating the  key.

Escape sequences are shown with a space between each character to make the command easier to read—don't enter the spaces. When a space character is part of a command sequence, it's explicitly shown as

ESC SPACE

Variables within an escape sequence are shown in italics. For example, the format for the ESC G command is

ESC G *attr*

where *attr* represents a character display attribute value.

The values for the variables are listed alphabetically in Table G-7; some of them are also listed in the text immediately following the command.

SELECTING A PERSONALITY **Select terminal personality** **ESC ~ *pers***

where *pers* is the personality selected.

- **Caution** The terminal may clear the display memory when executing this command.

Enhance Mode **Turn enhance mode off (default)** **ESC ~ SPACE**
Turn enhance mode on **ESC ~ !**

In enhance mode, the terminal supports additional features in other ASCII personalities (see Table G-6 in the “ASCII Command Summary” section).

COMMUNICATING WITH THE COMPUTER

The commands described in this section control the transmission of data to the host, the terminal and its keyboard, and the way in which that communication occurs.

Communication Modes **Turn full-duplex mode on (default)** **ESC C ESC D F**
Turn half-duplex mode on **ESC C ESC D H**
Turn block mode on **ESC B**
Turn half-duplex block mode on **ESC D H ESC B**

Figure 1-1 (in Chapter 1) illustrates the effects of these modes on how data is sent to the screen and the host.

The only key codes automatically transmitted to the host in block mode are those generated by

- The break key (**F5** on the 105-Key ANSI keyboard, **Break** on the ASCII or Enhanced PC-style keyboard)
- The corner key (**Compose Character**, **Func**, or **Alt** *left* depending on your keyboard) when the Corner Key setup parameter is set to *func*
- The function keys when their direction is *remote*

Requesting the Terminal's ID	Send terminal ID When this sequence is received, the terminal returns to the host the four-byte sequence 350 CR	ESC SPACE
-------------------------------------	---	------------------

Sending an Acknowledgement	Send acknowledgement (ACK) If ACK mode is on in setup mode, the terminal returns an ACK (CTRL F) character in response to a received ENQ (CTRL E) character. If ACK mode is off, no ACK character is sent. <input type="checkbox"/> Note Some escape sequences are designed to send an ACK after the command is executed; if ACK mode is off, the ACK will not be sent.	CTRL E
-----------------------------------	---	---------------

Controlling Transmission	Suspend transmission (XOFF) If you have set the Transmit Handshake parameter to XON/XOFF and the host supports XON/XOFF, this control character suspends data transmission to the host port. Resume transmission (XON) If you have set the Transmit Handshake parameter to XON/XOFF and suspended data transmission to the host port with DC3 (CTRL S), and the host supports XON/XOFF, this control character resumes data transmission.	CTRL S CTRL Q
---------------------------------	--	------------------------------------

CONTROLLING THE TERMINAL AND KEYBOARD	Sound bell Lock keyboard Unlock keyboard When the keyboard is locked, all keys are ignored except <input type="checkbox"/> F5 (<input type="checkbox"/> Break), <input type="checkbox"/> F3 (<input type="checkbox"/> Setup, <input type="checkbox"/> Select), <input type="checkbox"/> Compose Character (<input type="checkbox"/> Funct, <input type="checkbox"/> Alt <i>left</i>), and the function keys. Turn keyclick off Turn keyclick on (default)	CTRL G CTRL O or ESC # CTRL N or ESC " ESC e \$ ESC e %
--	---	--

Redefining the Keys	You can redefine the function keys and editing keys from the host with the following escape sequences: • ESC z redefines a function key (shifted and unshifted); the direction defaults to <i>remote</i> .	
----------------------------	---	--

- ESC Z redefines a function key or user-definable editing key and redefines its direction.

A total of 512 bytes of nonvolatile memory is available for storing key definitions. To save the definitions in nonvolatile memory, put the terminal in setup mode and exit with the *exit setup and save* option.

- **Note** If you connect another keyboard to the terminal after you've saved key redefinitions in nonvolatile memory, clear the definitions to their default values.

Program function key definition	ESC z <i>fkey</i> sequence DEL
Program key direction and definition	ESC Z <i>dir fkey</i> sequence DEL or ESC Z <i>dir</i> key sequence DEL

where *fkey* is a function key

key is a user-definable editing or special key

dir is the key's direction

sequence is the key's definition

The ESC z command redefines a function key. The ESC Z command redefines both the direction and definition of either a function key or a user-definable editing or special key. You can load up to 78 bytes in each key.

Clearing Key Definitions

Clear function key definition	ESC z <i>fkey</i> DEL
--------------------------------------	------------------------------

This command restores the default definition to the specified function key.

Clear redefinable key direction and definition	ESC Z <i>dir fkey</i> DEL or ESC Z <i>dir</i> key DEL
---	--

This command restores the default direction and definition to the specified user-definable key.

Controls Mode

Turn controls mode on	ESC U
Turn controls mode off (default)	ESC u or ESC X

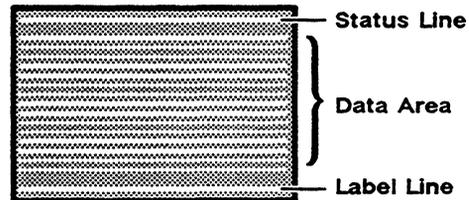

When controls mode (sometimes called *monitor mode*) is on, the terminal displays symbolic representations of received codes but does not execute the codes.

Table E-3 in Appendix E shows how control characters are displayed when controls mode is on.

**CONTROLLING DISPLAY
FEATURES**

With the commands in this section you can control the appearance of the display and the configuration of the three screen areas: the status line (top), the label line (bottom), and the data area.

Figure G-1 Screen Areas

Turning on the Screen Display	Turn screen display off	ESC ` 8
	Turn screen display on (default)	ESC ` 9
Reversing the Screen	Reverse screen	ESC ^ 1
	Restore normal screen	ESC ^ 0
Reversing the screen exchanges the foreground and background colors.		
Controlling Scrolling Speed and Type	Set scrolling speed and type	ESC ` scroll
	If you choose smooth scrolling, select some type of receive handshaking for the host port so the terminal can control the rate at which data is received. Since the screen may display data slower during smooth scrolling than it is receiving it, the buffer may overflow.	
Displaying the Cursor	Set cursor display features	ESC ` cursor
	You can control whether the cursor is displayed as a block, blinks, or is blank.	
Programming a Status Line Message	Program and display host message on status line	ESC F message CR
	where <i>message</i> is a string of up to 47 characters for an 80-column screen, 99 characters for a 132-column screen, or 128 characters for a 161-column screen. The message is displayed on the top status line.	

**Programming a Label
Line Message**

Program and display unshifted label line	ESC z (<i>text</i> CR
Program and display shifted label line	ESC z) <i>text</i> CR
Turn off shifted label line display	ESC z DEL
Clear unshifted label line message	ESC z (CR
Clear shifted label line message	ESC z) CR

where *text* is a string of up to 79 characters for an 80-column screen, 131 characters for a 132-column screen, or 160 characters for a 161-column screen.

The unshifted label line message is displayed automatically. Unless you turn off the display of the shifted label line, it's displayed when  is pressed.

- Note** You can prevent the display of the unshifted label line by assigning the blank display attribute (ESC A 1 1) to the label line. The assigned attribute will apply to both the unshifted and shifted label lines.

**Programming a Function
Key Label**

Program and display a function key label	ESC z <i>field label</i> CR
Clear a function key label	ESC z <i>field</i> CR

where *field* selects the function key to be labeled

label is a character string

The number of columns displayed determines the number of function key fields you can label and the number of characters each of those labels can contain.

**Table G-1 Function Key
Label Sizes**

No. of Columns	No. of Labels	No. of Characters in Label
80	8 ¹	8
132	16 ²	7
161	16 ²	8

1. An additional 8 labels are available on the shifted function key label line.
 2. An additional 16 labels are available on the shifted function key label line.
-

Defining the Data Area

You can change the line and column display either in setup mode or from the host.

Changing the Number of Displayed Columns

Before you change the number of displayed columns, clear the function key labels. You can program them again for the new display width.

Select 80-column display (default)

ESC ` :

Select 132-column display

ESC ` ;

Allow for a brief delay before sending data to the terminal.

The command to select 132 columns is ignored during dual-session operation with a vertically split screen.

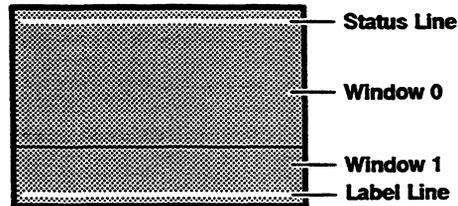

- Note** Changing the terminal to 161 columns can be done only in setup mode.

Splitting the Screen

By dividing the screen's data area into two horizontal windows (as shown in Figure G-2), you can display data in one window while working in the other window. Although initially the top data window is the active window, your program can change the active window. Both windows display the same number of columns.

- Note** Do not confuse this type of split screen with those discussed in Chapter 6. This type can be used in addition to a vertical split between sessions (but not with a horizontal split).

Figure G-2 Split Screen Format

Split screen horizontally and save data

ESC x A *line*

Split screen horizontally and clear page

ESC x 1 *line*

where *line* is a value corresponding to the line number on the top line in what will be the lower window (Window 1 in Figure G-2).

Executing either of these commands moves the cursor to the home position of the upper window and displays the bottom portion of the page in the lower window.

Both commands turn off protect mode.

If these escape sequences originate from the host, the terminal returns an ACK character to the host (if ACK mode is on).

If you have also configured the terminal to display two sessions on a vertically split screen, you can split the screen horizontally within either or both of those sessions. You cannot, however, split the screen again if you've split it into horizontal windows.

- Note** These commands are ignored if you have split the screen between two pages. The commands are only recognized when one page is defined.

Activating a Window

Activate upper window

ESC J

Activate lower window

ESC }

Activate the other window

ESC J

or ESC K

When you reactivate a window, the cursor appears in its previous position within that window and the data in the other (now inactive) window becomes fixed.

- Note** When the screen has not been split, the ESC J or ESC K commands display the previous or next page when more than one page is defined in setup mode.

Restoring a Full Screen Format

Redefine screen as one window

ESC x @

Redefine screen as one window and clear page

ESC x 0

Redefining the screen as one window homes the cursor and turns off protect mode.

If this sequence originates from the host, the terminal returns an ACK character to the host (if ACK mode is on).

PROTECTING DATA

The combination of write-protect and protect modes allows you to create forms in which some data cannot be changed by the user while filling in blank areas of the form. Protect mode also allows your program to control transmission of the data and keep it from scrolling off the screen.

Protecting data on the screen involves three steps:

- 1 Turn on write-protect mode.
- 2 Enter the data to be protected.
- 3 Turn on protect mode to protect the data entered in write-protect mode.

Protected data is treated differently from unprotected data in several editing, clear, and send commands. (See "Protecting Write-Protected Data" and "Editing.")

Writing Data to be Protected **Turn write-protect mode off (default)** **ESC (**
Turn write-protect mode on **ESC)**

When write-protect mode is on, all subsequently received characters are displayed and stored with the display attribute selected for write-protected characters.

Assigning Display Attributes to Write-Protected Characters **Assign display attribute to write-protected characters** **ESC *w* *pca***

where *wpca* is a write-protected display attribute

<i>wpca</i>	Display Attribute
6	Reverse
7	Dim
A	Normal
B	Dim, reverse
C	Underline
D	Dim, underline
E	Underline, reverse
F	Dim, reverse, underline
G	Extended character set

When write-protect mode is on, this command assigns a display attribute to write-protected characters. The color of the characters depends on the currently selected color palette (see the next section, “Assigning Display Attributes and Colors,” for a discussion of the color palettes). You can change the color of write-protected characters by sending the command

ESC m 8 color 0

where *color* is one of the terminal’s 64 colors from Table G-5 in the next section.

- Note** Selecting the extended character set displays characters from the ISO Latin-1 character set, which is illustrated in Appendix A. (This is a different extended character set from that provided on the WY-350 terminal.)

Write-Protecting a Column **Clear cursor column to write-protected spaces** **ESC V**

- Note** The terminal doesn’t have to be in write-protect mode to execute this command.

Protecting Write-Protected Data

Turn protect mode off (default)
Turn protect mode on

ESC '
ESC &

When protect mode is on,

- The cursor can't be moved into a protected area. If addressed there, it will jump to the first unprotected position when data is entered.
- Tabulating commands move the cursor to the first unprotected character position beyond a protected tab stop.
- No data can scroll off the screen.
- A line in a protected screen cannot be inserted or deleted.

ASSIGNING DISPLAY ATTRIBUTES AND COLORS

Five display attributes—*dim*, *reverse*, *underline*, *blink*, and *blank*—can be assigned, individually or in combination, to characters or to areas of the screen.

Each attribute or attribute combination is associated to one of four colors from the terminal's current *foreground color palette*. You can select from 16 premixed palettes, or you can create your own palettes from any of the terminal's 64 colors. Table G-2 summarizes the commands that allow you to select colors and display attributes and assign them to characters or to areas of the screen. These commands are discussed in detail in the sections that follow the table.

Table G-2 Display Attribute/Color Commands

Command Name/Sequence	Description
Assign display attribute to a message field: ESC A <i>mf attr</i>	Assigns a display attribute/color to selected screen areas
Assign character display attribute: ESC G <i>attr</i>	Assigns a display attribute/color to characters
Assign write-protected* character display attribute: ESC ` <i>wpca</i>	Assigns a display attribute/color to write-protected characters
Select foreground color palette: ESC % <i>fcolor</i>	Selects one of the premixed palettes of colors that are associated to the display attributes

* Command discussed in previous section, "Protecting Data."

**Table G-2 Display Attribute/
Color Commands, Continued**

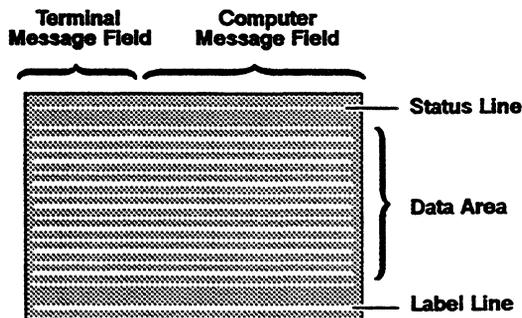

Command Name/Sequence	Description
Redefine color association: ESC m <i>attr-c color attr-n</i>	Redefines the palette's color/ attribute associations, allowing you to create a customized palette

**Assigning Display Attributes
to a Message Field****Assign display attribute to a message field****ESC A *mf attr***where *mf* is an area of the screen

<i>mf</i>	Screen Area
0	Data area
1	Label line
2	Terminal message field on status line
3	Computer message field on status line

attr is a display attribute from Table G-3

The message fields are shown in Figure G-3.

Figure G-3 Message Fields

This command assigns a display attribute to the specified area of the screen until another attribute is encountered.

Table G-3 Display Attributes

<i>attr</i>	Display Attribute	Color Association*
SPACE	Space character	
0	Normal	Normal
1	Blank (no display)	Normal
2	Blink	Normal
3	Blank and blink	Normal
4	Reverse	Reverse
5	Reverse and blank	Reverse
6	Reverse and blink	Reverse
7	Reverse, blink, blank	Reverse
8	Underline	Underline
9	Underline and blank	Underline
:	Underline and blink	Underline
;	Underline, blink, blank	Underline
<	Underline and reverse	Underline, reverse
=	Underline, reverse, blank	Underline, reverse
>	Underline, reverse, blink	Underline, reverse
?	Underline, reverse, blank, blink	Underline, reverse
p	Dim	Dim
q	Dim and blank	Dim
r	Dim and blink	Dim
s	Dim, blink, and blank	Dim
t	Dim and reverse	Dim, reverse
u	Dim, reverse, blank	Dim, reverse
v	Dim, reverse, blink	Dim, reverse
w	Dim, reverse, blank, blink	Dim, reverse
x	Dim and underline	Dim, underline
y	Dim, underline, and blank	Dim, underline
z	Dim, underline, and blink	Dim, underline
{	Dim, underline, blink, and blank	Dim, underline

* Color association in foreground color palette; refer to Table G-4 for colors.

Table G-3 Display Attributes,
Continued

<i>attr</i>	Display Attribute	Color Association*
	Dim, reverse, underline	Dim, reverse, underline
}	Dim, reverse, underline, blank	Dim, reverse, underline
~	Dim, reverse, underline, blink	Dim, reverse, underline
DEL	Dim, reverse, underline, blank, blink	Dim, reverse, underline

Assigning Display Attributes to Characters

Assign character display attribute

ESC G *attr*

where *attr* is a display attribute from Table G-3

The assigned display attribute is *nonhidden*; that is, it will occupy the current cursor position, appearing on the screen as a space character. It affects all characters to the right and below it—to the end of the screen or until a different attribute is encountered. If the starting position of an attribute is overwritten, the attribute is no longer assigned and the display will change.

The display attributes listed in Table G-3 are grouped into eight possible *color associations* for the purpose of color assignments. A color association is simply a named grouping of display attributes assigned a common color. For instance, all display attribute combinations of *underline* and *reverse* with *blink* and *blank* are grouped under a color association named *underline, reverse*.

Each character assigned a display attribute will be displayed in the foreground color that corresponds to its color association in the currently selected foreground color palette.

For example, a character assigned the underline, reverse attribute

ESC G <

will be displayed in the same color as a character assigned the underline, reverse, blank, blink attribute

ESC G ?

because they are both grouped under the color association *underline, reverse*.

Table G-4 lists the predefined colors assigned to each color association in the different color palettes.

Note Background colors for characters can be selected only in setup mode.

Table G-4 Foreground Color Palettes

Palette ¹	Color Association							
	Normal	Reverse	Underline	Underline, Reverse	Dim	Dim, Reverse	Dim, Underline	Dim, Reverse, Underline
0	Amber	White	Pale yellow	Pale yellow	Red-orange	Red-orange	Red-orange	Red-orange
1	Green	Cyan	Faded blue-green	Faded blue-green	Light blue-green	Light blue-green	Light blue-green	Light blue-green
2	White	Yellow	Amber	Amber	Red	Red	Red	Red
3	Cyan	White	Green	Green	Electric blue	Electric blue	Electric blue	Electric blue
4	Light purple	Hot pink	Bright blue	Bright blue	Faded rose	Faded rose	Faded rose	Faded rose
5	Yellow	Red-orange	Orange-brown	Orange-brown	Deep red	Deep red	Deep red	Deep red
6	Sky blue	Blue-green	Chartreuse	Chartreuse	Bright green	Bright green	Bright green	Bright green
7	Light gray	Blue-purple	Medium blue	Medium blue	Charcoal gray	Charcoal gray	Charcoal gray	Charcoal gray
8	Light green	Chartreuse	Bright green	Bright green	Khaki green	Khaki green	Khaki green	Khaki green
9	Cream	Orange-brown	Sage green	Sage green	Tan	Tan	Tan	Tan
:	White ²	Sky blue	Chartreuse	Magenta	Blue-green	Purple	Amber	White
;	White ²	Red-orange	Green	Yellow	Blue	Light purple	Cyan	White

1. The ASCII characters in this column are the values for the command that selects the palette (ESC % fcolor). Palettes 0 through 9 can also be selected from the keyboard: Press Ctrl Shift together with the number key on the numeric keypad.

2. Palette for CRT color adjustment; display attributes are not active.

Table G-4 Foreground Color Palettes, Continued

Palette ¹	Color Association							
	Normal	Reverse	Underline	Underline, Reverse	Dim	Dim, Reverse	Dim, Underline	Dim, Reverse, Underline
<	Green ³	Green	Green	Green	Bright green	Bright green	Bright green	Bright green
=	White ⁴	White	White	White	Light gray	Light gray	Light gray	Light gray
>	Amber	Amber	Amber	Amber	Orange-brown	Orange-brown	Orange-brown	Orange-brown
?	White ²	Red	Green	Yellow	Blue	Light purple	Cyan	Amber

3. Simulated monochrome green.

4. Simulated monochrome white.

The default color palette is the amber palette (0=amber, white, pale yellow, and red-orange).

- Note** All color associations containing the dim attribute share the same color except in the three palettes provided for CRT color adjustment; those palettes assign a unique color to each color association.

Examples of Assigning Character Display Attributes

The following examples demonstrate the effects of assigning display attributes to characters.

When the default amber color palette is the current palette, the command

ESC G 2

displays blinking amber characters (blink attribute assigned; color association = normal). The command

ESC G 8

displays underlined pale yellow characters (underline attribute assigned; color association = underline). The command

ESC G >

displays blinking, underlined black characters on a pale yellow background (underline, reverse, blink attribute assigned; color association = underline, reverse)

Changing the Current Color Palette

Select foreground color palette

ESC % *fcolor*where *fcolor* is a foreground color palette

<i>fcolor</i>	Foreground Color Palette
0	Amber
1	Green
2	White
3	Cyan
4	Light purple
5	Yellow
6	Sky blue
7	Light gray
8	Light green
9	Cream
:	Reverse tertiary colors
;	Reverse primary/secondary colors
<	Simulated monochrome green
=	Simulated monochrome white
>	Simulated monochrome amber
?	Normal primary/secondary

When you change the foreground color palette,

- All characters on the screen immediately change to the new palette colors (see Table G-4)
- Any color associations that have been redefined change back to their default definitions

Examples of Selecting a New Color Palette

Suppose you had sent the command

ESC G 8

to assign the underline attribute when the default amber palette was in effect, resulting in pale yellow underlined characters. If you then sent the command

ESC % 3

to change to the cyan palette, all characters on the screen that were formerly underlined pale yellow would change immediately to underlined green (see Table G-4).

Redefining the Color Associations

Redefine color association

ESC m *attr-c* color *attr-n*

where *attr-c* is a color association in the currently selected color palette

<i>attr-c</i>	Color Association
0	Normal
1	Reverse
2	Dim
3	Underline
4	Dim, reverse
5	Underline, reverse
6	Dim, underline
7	Dim, reverse, underline
8	Write-protect

color is any one of 64 colors from Table G-5

attr-n is a new definition of the attribute characteristics of the color association

<i>attr-n</i>	New Attribute
0	Normal
-	Reverse
.	Underline
/	Underline, reverse

- Note** An *attr-c* value of 8 (write-protect) assigns a new color, but not a new attribute, to write-protected characters; *attr-n* must be entered but will be ignored.

This command allows you to create your own color palette. When you issue the command, you first decide what color association in your selected palette you want to redefine (*attr-c*); then you select the new color (*color*) and the new attribute (*attr-n*).

Examples of Redefining the Color Association

The command

ESC m 5 , .

assigns the color *turquoise* to the *underline, reverse* color association in the currently selected color palette and, in addition, redefines it as underline only.

This redefinition affects *only* the one color association, *underline, reverse*. For example, if the white color palette were the current palette (ESC % 2), the *reverse* color association remains yellow and the *underline* color association remains amber (see Table G-4).

Table G-5 Color Table

<i>color</i> ⁶	Foreground Color	<i>color</i> ⁶	Foreground Color
1	Black (normal)		Medium green
)	Black	~	Khaki green
!	Black	m	Sage green
		p	Pale green
?	Indigo	o	Chartreuse
&	Violet	/	Dull chartreuse
x	Light violet		
		7	Yellow
"	Dark blue	}	Pale yellow
*	Deep blue	y	Amber
2	Blue	_	Cream
] ^	Powder blue		
^	Medium blue	8	White
a	Blue gray		
b	Light blue	z	Tan
		i	Orange brown
9	Electric blue		
:	Bright blue	u	Red orange
<	Sky blue	5	Red
\	Blue purple	-	Deep red
n	Light blue purple	%	Brick red
\$	Teal blue	s	Hot pink
,	Turquoise	t	Magenta
>	Blue green	v	Pale pink
:	Light blue green	w	Purple pink
e	Pale blue green		
q	Faded blue green	h	Purple
		.	Medium purple
4	Cyan	6	Light purple
f	Light cyan	!	Pale purple
r	Pale cyan	{	Faded purple
=	Sea green	g	Rose
d	Sea foam green	j	Faded rose
`	Green blue		
#	Grass green	l	Purple blue
3	Green	k	Purple gray
+	Bright green	o	Light gray
c	Lime green	(Charcoal gray

6. Color names are for convenience of reference and are not based on any scientific or artistic criteria. The names are intended only as guidelines within a range of colors.

The only characters on the screen that would be affected would be characters assigned the following attributes (see Table G-3):

- Underline and reverse (ESC G <)
- Underline, reverse, blank (ESC G =)
- Underline, reverse, blink (ESC G >)
- Underline, reverse, blank, blink (ESC G ?)

These characters would be displayed as turquoise and underlined (but not reversed).

The following example demonstrates how you might create your own customized color palette, starting with the default amber palette as the current palette:

- 1 Change the *reverse* color association to sage green (instead of white):

ESC m 1 m -

- 2 Change the *dim* color association to pale green (instead of red-orange):

ESC m 2 p 0

- 3 Change the *underline* color association to blue and reverse (instead of pale yellow and underlined)

ESC m 3 2 -

The color associations for the palette would now look like this:

Normal = amber

Reverse = *sage green*

Underline = *blue reversed*

Underline, reverse = pale yellow

Dim = *pale green*

Dim, reverse = red-orange

Dim, underline = red-orange

Dim, reverse, underline = red-orange

- Note** Changing to a new foreground color palette changes all the colors and attributes to the default definitions in the new palette.

individually with an escape sequence that allows the characters to be entered one at a time in the normal operating mode.

Turn graphics mode on	ESC H CTRL B
Turn graphics mode off	ESC H CTRL C
Display one graphics character	ESC H <i>ldraw</i>

where *ldraw* is a single line-drawing character

When graphics mode is on, you can't enter normal alphanumeric text, but you can enter commands. When protect mode is on, graphics characters are automatically protected.

CONTROLLING THE CURSOR

These commands control the cursor's position on the screen, define what happens as additional data is entered, and allow you to move the cursor to an exact position or read its current location.

Cursor Movement

Move cursor left	CTRL H
Move cursor right	CTRL L
Move cursor up; no scroll	CTRL K
Move cursor up; scroll (reverse linefeed)	ESC j
Move cursor down; scroll (linefeed)	CTRL J
Move cursor to start of line	CTRL M
Move cursor to start of next line	CTRL _
Move cursor to home position in current page	ESC { or CTRL ^

Cursor Modes

Turn end-of-line wrap mode off	ESC d .
Turn end-of-line wrap mode on (default)	ESC d /
Turn autopage mode off (default)	ESC w
Turn autopage mode on	ESC v
Turn autscrolling mode off	ESC N
Turn autscrolling mode on (default)	ESC O

End-of-line wrap and autopage modes define whether or not data added as the cursor reaches the end of the line or page will be seen on the next available line or page.

When autscrolling mode is on, entering a character on the last line at the last column position causes the data to scroll up one line, fills the last line with space characters, and moves the cursor to the first column of that line. The line that scrolled off the top of the screen is lost.

When autscrolling is off, entering a character on the last line at the last column position moves the cursor to the home position (or the first unprotected position).

- Note** Turning protect mode on temporarily disables autoscrolling mode and turns off page edit in setup mode.

Addressing/Reading the Cursor

With these commands you can define precisely the line, column, and page or window where the cursor is to be positioned, or request the terminal to report that position to the host.

- Note** Although you can address the cursor to a protected position, it will not be able to write anything there.

Addressing the Cursor

Address cursor in current 80-column page **ESC = line col**

Address cursor in specific 80-column window/page **ESC - wnd/page line col**

Address cursor in current 80/132/161-column page **ESC a ll R ccc C**

where **R** is the ASCII character **R**

C is the ASCII character **C**

Reading the Cursor Address

Read cursor address in 80-column current page **ESC ?**

Read 80-column window (or page) number and cursor address **ESC /**

- Note** This window is not related to session-type splits.

In 80-column mode, the terminal returns the cursor's address in the following formats:

line col CR

page line col CR

wnd line col CR (if screen is split)

page line col CR (if screen is not split)

CR is the carriage return that terminates the sequence.

Read cursor address in current 80/132/161-column page **ESC b**

The terminal returns a string of up to seven bytes in the format

// R ccc C

where **ccc** One- to three-decimal value of column (relative to home) where the cursor is to be positioned

// One- or two-decimal value of line (relative to home) where the cursor is to be positioned

No **CR** character is sent after the coordinates.

EDITING

This section describes tab stops and how to insert, delete, and clear data.

Tab Stops

Clear all tab stops **ESC 0**
Set tab stop at cursor position **ESC 1**
Clear tab stop at cursor position **ESC 2**
Tabulate cursor **ESC i**

or CTRL I
ESC I

Backtab

- Note** If you set a tab at any position, a tab is also automatically set at column one. Clearing the tab in column one makes it appear as though there are no other tabs set (temporarily disabling the other tabs).

When tabbing forward or backward, the cursor moves to the next or previous unprotected position if the tab stop is at a protected position.

Inserting Data

Turn insert mode on, replace mode off **ESC q**
Turn insert mode off, replace mode on (default) **ESC r**

When insert mode is off, each character entered replaces the existing character at the cursor position. When insert mode is on, the character at the cursor position and any characters to the right on the same line move right for each character entered.

Insert space character at cursor position **ESC Q**
Insert line of space characters **ESC E**

When a line of space characters is inserted, the line that moves off the bottom of the page is lost. If protect mode is on, the command is ignored.

Deleting Data

Delete cursor character **ESC W**

This command deletes the cursor character, pulling the following characters on the line back toward the cursor position. A space character is added at the end of the line or in the last position before a protected field.

Delete cursor line **ESC R**

This command deletes the entire cursor line, moving all following lines up one line and moving the cursor to the start of the line. If protect mode is on, the command is ignored.

Clearing Data

The following commands replace characters with nulls, spaces, or specified characters.

Clearing a Page

Clear page to null characters	ESC *
Clear page to space characters	ESC +
Clear page to write-protected space characters	ESC ,
Clear cursor column to write-protected spaces	ESC V
Clear unprotected page to space characters	ESC ; or CTRL Z
Clear unprotected page to null characters	ESC :
Clear unprotected page to a specific character	ESC . char

Executing these commands also homes the cursor and turns off protect mode. Executing ESC * or ESC + or ESC , also turns off write-protect mode and insert mode.

Clearing to the End of a Page or Line

Clear unprotected page to space characters from cursor	ESC Y
Clear unprotected page to null characters from cursor	ESC y
Clear unprotected line to space characters from cursor	ESC T
Clear unprotected line to null characters from cursor	ESC t

These commands replace unprotected characters from the cursor position to the end of the page or line, or to the start of a protected field, with space or null characters.

Clear unprotected page to display attribute	ESC ! attr
--	-------------------

where *attr* is a display attribute from Table G-3

This sequence clears unprotected characters on the page to a display attribute, assigning the same attribute to every unprotected character position. This makes it easy to create forms that display primarily one kind of attribute for all fields. You can also clear the page to the normal attribute (ESC ! 0) to eliminate flashing when generating the form (i.e., the attribute won't flash onto the entire screen to the right of the cursor but will display only where data is entered).

- Note** When you clear the screen to any except the normal attribute, don't enter data in the first position (line one, column one) or the attribute won't take effect in that line.

SENDING DATA IN BLOCK MODE

When you send data in block mode to either the host or the printer,

- The terminal automatically includes end-of-transmission delimiters (called *terminators*) according to the value selected for the Block End parameter in setup mode
- If protect mode is on, graphics characters are sent as space characters
- Null characters are sent as space characters
- Data is sent from the start of the page or line up to and including the cursor position

Sending a Character or Line

Send cursor character

ESC M

Send cursor line

ESC 6

Send unprotected cursor line

ESC 4

No delimiter is sent after the cursor character is sent.

Sending a Page

Send page

ESC 7

Send unprotected page

ESC 5

If you've split the screen horizontally, only data from the active window is sent.

Sending a Block

To send a block of data,

1 Mark the beginning and end of the block with STX and ETX characters.

2 Send the block to the host.

Mark block beginning with STX character

ESC 8

Mark block end with ETX character

ESC 9

These sequences place a visible STX or ETX character at the cursor location.

Send block

ESC s

Send unprotected characters in block

ESC S

These commands send the data between the first STX character left of the cursor and the first ETX character after the first STX character to the left of the cursor. If no STX character is found to the left of the cursor, data is sent beginning at the home position. If no ETX character is found, the rest of the data on the page is sent. (The STX and ETX characters are not sent.)

When the block is sent, protected fields are bracketed with the ESC) code (write-protect on) and the ESC (code (write-protect off).

When only unprotected characters are sent, each protected field is replaced by the field separator code, FS (CTRL \).

PRINTING DATA

To send data to the terminal's printer port, either

- Send a page print command to print data from the terminal's display memory, or
- Turn on a print mode to print data coming from the host

Page Print Commands

When you print from the terminal's display memory,

- The printed copy can duplicate the format seen on the screen (formatted page) or it can be unformatted (i.e., a string of data)
- A formatted page includes the end-of-line delimiters CR, LF, and a null character
- No line terminators are sent with an unformatted page
- The terminal sends an ACK to the host at the end of the print operation (if ACK mode is on)

Print formatted page

ESC P

Print formatted unprotected page

ESC @

Print unformatted page

**ESC p
or ESC L**

Pass next incoming character to printer port

CTRL P *schar*

where *schar* is a single ASCII character

Print Modes

When one of the terminal's two print modes is on, the terminal sends all data received from the host to the printer port.

Turn print modes off (default)

CTRL T

Turn auxiliary print mode on

CTRL R

Turn transparent print mode on

**ESC d #
or CTRL X**

In auxiliary print mode, the data is displayed on the screen; in transparent print mode, the data isn't displayed.

Bidirectional Communication

Data can flow in both directions between devices attached to the terminal's host port and printer port.

Turn printer receive mode off (default)

ESC d SPACE

Turn printer receive mode on

ESC d !

In printer receive mode, data received by the terminal from a device connected to the printer port (such as a printer with a keyboard, or a bar-code reader) is sent directly to the host port without affecting the screen display. Data received from the host port is displayed on the screen but is not sent to the printer port.

Turn bidirectional mode off (default)

ESC d \$

Turn bidirectional mode on

ESC d %

Turning on bidirectional mode automatically turns on both printer receive and auxiliary print modes. Data received by the host port is displayed on the screen and sent to the printer port. Data received by the printer port is sent directly to the host port without affecting the screen display.

Turning off bidirectional mode turns off printer receive mode and all print modes.

ASCII COMMAND SUMMARY

Table G-6 lists the commands supported by the terminal in its ASCII personalities. Table G-7 lists the values for the variable parameters in the commands in Table G-6. Table G-8 lists national replacement characters for each keyboard language in ASCII personalities.

In Table G-6, columns other than the Wyse 350 column show the support for the command in other ASCII personalities according to the following notations:

- Same = Same as Wyse 350 code—code is native to the other terminal
- Wyse = Wyse enhancement—Wyse 350 code is not native to the other terminal but is always executed
- ENH = Wyse enhancement—Wyse 350 code is not native to the other terminal but is executed in enhanced mode

A blank in any column indicates that the command is not supported. A specific code listed in any column other than the Wyse 350 column indicates that the other terminal's native code is supported.

- **Note** Codes native to other terminals are given in abbreviated form. Refer to the other terminal's documentation for complete information on the indicated command and its associated parameter values.

Variables are shown in italics. Their values are listed alphabetically in Table G-7.

The terminal does not support the following TeleVideo 950 and Esprit III commands:

- ESC c (enter local mode)
- ESC 0 (program send key)
- ESC Z (transmit user/status line)

Table G-6 Commands Supported in ASCII Personalities

Command	Command Sequence			
	Wyse 350	ADDS A2	TVI 950	Esprit III
Selecting Personalities

Set cursor display features	ESC ` <i>cursor</i>	ENH	ESC .	ESC .

4. The unshifted label line is automatically displayed in the native, Wyse 350, and ADDS VP A2 personalities. In these personalities the label line message (both unshifted and shifted) can be hidden by assigning the blank attribute (ESC A 1 1), and displayed again by assigning any nonblank attribute.

5. Command is ignored during a dual session if the screen is vertically split.

TEK 4010/4014 Command Summary

TEK 4010/4014 PERSONALITY COMMANDS

This description of the terminal's operation in TEK 4010/4014 personality assumes a basic familiarity with Tektronix 4010/4014 graphics. Table H-1 summarizes the modes and command features supported by the terminal in this personality.

Table H-1 TEK 4010/4014 Personality Features

Feature	Function
Alpha mode	Process text
Graph mode	Draw vectors between specified absolute coordinates
Incremental plot mode	Plot points in one-point increments relative to current display beam position
Point plot mode	Draw single dots at points specified by absolute coordinates
Special point plot mode	Draw single dots as in point plot mode but with an intensity character preceding each point plotted; dots will be drawn only if the intensity is 50 percent or more
Graphic input (GIN) mode	Report graphic information to computer, position crosshair cursor from keyboard or mouse
Bypass condition	Prevent terminal response to data echoed from computer

Key Functions

Function keys are user-definable in setup mode; they send no default codes.

See Table C-4 for local keyboard commands supported in TEK 4010/4014 personality.

Control Codes and Escape Sequences

Table H-2 lists the control codes and escape sequences recognized by the terminal in TEK 4010/4014 personality. Following the table are "Programming Notes" with more detailed information on some of the commands listed in the table. These additional notes are referenced by a bracketed number, e.g., [1], in the "Notes" column of the table.

Table H-2 TEK 4010/4014 Personality Commands

Command	Sequence	Notes ¹
Modes		
Select 4010/4014 personality (alpha mode)	ESC [? 38 h	From Native, VT320/220 or VT100 personality
Return to personality from which entered	ESC [? 38 l	
Select foreground and background colors	ESC [<i>Ps</i> ; <i>PsI</i> x	[1]
<i>Ps</i> Foreground color (0-64) from Color Table		
<i>PsI</i> Background color (0-64) from Color Table		
Select graph mode	GS or ESC GS	GS = CTRL] [2]
Select incremental plot mode	RS or ESC RS	RS = CTRL ^ [3]
Select point plot mode	FS	FS = CTRL \ [4]
Select special point plot mode	ESC FS	FS = CTRL \ [5]
Select graphic input (GIN) mode	ESC SUB	SUB = CTRL Z [6]
Reset to alpha mode and clear bypass condition	US or ESC US	US = CTRL _
Reset to alpha mode, clear screen, home cursor, and clear bypass condition	ESC FF	FF = CTRL L
Terminal and Display Control		
Set bypass condition	ESC CAN	CAN = CTRL X Prevents response to data echoed from computer
Clear bypass condition	BEL	BEL = CTRL G Also sounds bell
Request terminal status	ESC ENQ	ENQ = CTRL E Also sets bypass condition [7]

1. Numbers in brackets refer to the Programming Notes that follow this table.

**Table H-2 TEK 4010/4014
Personality Commands,
Continued**

Command	Sequence	Notes ¹
Terminal and Display Control, Continued		
Sound bell	BEL or ESC BEL	BEL = CTRL G Also clears bypass condition
Prevent response to carriage return/linefeed	ESC CR or ESC LF	CR = CTRL M LF = CTRL J Until cleared by receipt of any character or control code except CRLF
Direct beam without drawing (dark vector)	GS	GS = CTRL]
Select character size: 80 characters/line, 36 lines/page 128 characters/line, 60 lines/page	ESC 8 or ESC 9 ESC : or ESC ;	Alpha mode
Cursor Movement		
Move cursor left one position	BS	BS = CTRL H
Move cursor right one position	HT	HT = CTRL I
Move cursor down one line (linefeed)	LF	LF = CTRL J Also clears bypass condition
Move cursor up one line	VT	VT = CTRL K
Move cursor to start of line (carriage return)	CR	CR = CTRL M Also resets terminal from graph to alpha mode, cancels crosshair cursor, clears bypass condition
Print Screen		
Print the screen	ESC ETB	ETB = CTRL W ² [8]
<p>2. To print the screen from the keyboard, press F2 on the 105-Key ANSI keyboard, Print on the ASCII keyboard, or Print Screen on the Enhanced PC-style keyboard.</p>

Programming Note [2]**Graph Mode**

In graph mode vectors are drawn between specified absolute coordinates. The control character GS puts the terminal in graph mode; within graph mode GS defines the start of a vector by directing the display beam to the specified address without displaying the vector (dark vector).

- Note** The graphics screen is cleared when setup mode is entered from TEK 4010/4014 personality.

Encoding Coordinates

By mapping TEK points to the nearest corresponding pixels on its 640- by 480-pixel display, the terminal supports the Tektronix address ranges of 1024X x 1024Y (requiring 10-bit addressing) or 4096X x 4096Y (requiring 12-bit addressing). (The matrix visible on the screen is 1024 x 780 or 4096 x 3128.) The display beam is addressed to a point on the screen by sending the binary equivalent of each coordinate, encoded into four bytes for 10-bit addressing or

- 3** In Table H-5 find the coordinate byte values for the vector's starting point. Look them up in the order they must be sent (Table H-3): high Y, low Y, high X, low X.
- Find the Y coordinate (200) in the body of the chart. Find the high Y byte (ASCII &) at the top of the chart and the low Y byte (ASCII h) at the right.
 - Find the X coordinate (0) in the body of the chart. Find the high X byte (ASCII SP) at the top of the chart and the low X byte (ASCII @) at the right.
- 4** Send the command to locate the display beam at the starting point. (Since GS precedes the four-byte coordinate address, no vector is drawn.)
- GS & h SP @**
- 5** Send the four-byte address for the 200Y, 500X coordinates to draw the dotted line.
- & h / T**
- 6** Send the four-byte address for the 0Y, 500X coordinates, prefaced by a command to select a solid line.
- ESC ` SP ` / T**

* If DEL = Low Y parameter in setup mode is set to *on*. If set to *off*, enter ESC ? instead.

Programming Note [3]**Incremental Plot Mode**

In incremental plot mode, points are plotted relative to the current active position. Table H-6 lists the ASCII characters to be entered to turn the display beam off and on (changing the active position) and move it in the directions indicated.

- Note** Movement is in TEK point increments; therefore, several characters may have to be entered before the actual pixel on this screen is turned on.

Table H-6 Incremental Plot Mode Controls

ASCII Character	Movement
SP	Beam off/pen up
P	Beam on/pen down
D	North
E	Northeast
A	East
I	Southeast
H	South
J	Southwest
B	West
F	Northwest

Programming Note [4]**Point Plot Mode**

In point plot mode single dots are drawn at points specified by the same absolute coordinates as in graph mode (see Table H-3).

Programming Note [5]**Special Point Plot Mode**

This mode is the same as point plot mode except that each point address is preceded by an intensity character, and the dot is drawn only if the intensity is 50 percent or more. Table H-7 lists the intensity characters.

Table H-7 Brightness Intensity Percentage

Programming Note [6]

Graphic Input (GIN) Mode

GIN mode is interactive: the terminal responds to computer requests for information. When the terminal enters GIN mode (ESC SUB),

- The bypass condition is set
- Keyboard or mouse input is sent to the computer with intersect address of crosshair cursor in 10-bit addressing format, followed by the GIN terminator if any (as selected in setup mode)

- Note** The Microsoft Mouse is supported. This device sends serial data at 1200 baud with 8 data bits, 1 stop bit, and no parity.

Moving the Crosshair Cursor

In GIN mode the crosshair cursor can be repositioned by the cursor keys or by using a mouse. Once the cursor is at the desired location, pressing any ASCII key or a mouse button sends the key value or button identifier, the crosshair cursor address, and the GIN terminator (if any) to the computer and puts the terminal in alpha mode.

Mouse button identifiers are F0H for the left button and F1H for the right button. The terminal supports a Microsoft Serial Mouse, or equivalent, connected to the auxiliary port.

- Note** When the terminal exits from GIN mode the bypass condition remains active until cleared by a control code.

Programming Note [7]

Terminal Response to ENQ

Alpha mode: Terminal status and address of bottom-left corner of current character

Graph mode: Terminal status and address of display beam
GIN mode: Crosshair cursor intersect address

Programming Note [8]**Printers**

Printers supported are IBM Pro Printer or printers compatible with IBM graphics protocol.

Termcap

INTRODUCTION

Termcaps are used by some computer systems to describe terminal capabilities so that one application may be used with many terminals. Unfortunately, there is no standard termcap. Many applications have custom extensions to the basic termcap, some of which are conflicting. For example, the *ct* capability means *clear tab* for one application and *color terminal* for another application. Because of this lack of standardization, terminal manufacturers cannot supply termcaps that will run on all applications. All termcaps must be checked and verified with the documentation supplied by the vendor for each application.

The following termcap is provided as a starting point for application vendors and users to build a termcap for their specific application.

- The termcap applies to a 24-line screen with a status line
- A different keyboard connected to the terminal will send different escape sequences
- In order for the cursor keys to work properly, the terminal may have to be configured for 8 data bits and 2 stop bits

Basic Terminal Without Function Keys

Quick Reference Guide

This appendix lists, in ASCII order, all of the commands presented in Chapters 2 through 10.

Sequence	Description	Mnemonic
CTRL E	Send answerback message	ENQ
CTRL G	Sound bell	BEL
CTRL H	Backspace cursor one column	BS
CTRL I	Tab cursor to next tab stop	HT
CTRL J	Move cursor down one line in current column	LF
CTRL K	Move cursor down one line in current column	VT
CTRL L	Move cursor down one line in current column	FF
CTRL M	Move cursor to start of line	CR
CTRL N	Assign G1 character set to GL	LS1 or SO
CTRL O	Assign G0 character set to GL	LS0 or SI
CTRL Q	Resume transmission (XON)	DC1
CTRL S	Suspend transmission (XOFF)	DC3
CTRL X	Abort current escape sequence	CAN
CTRL Z	Abort current escape sequence	SUB
ESC SPACE 0	Request terminal ID	WYID
ESC SPACE F	Select 7-bit transmission mode	S7CIT
ESC SPACE G	Select 8-bit transmission mode	S8CIT
ESC ! p	Terminal mode reset	WYSTR
ESC # 3	Display top half of double-high, double-wide line	DECDHL
ESC # 4	Display bottom half of double-high, double-wide line	DECDHL

Sequence	Description	Mnemonic
ESC # 5	Display single-high, single-wide line	DECSWL
ESC # 6	Display single-high, double-wide line	DECDWL
ESC # 8	Display screen adjustment pattern	DECALN
ESC # :	Display top half of double-high, single-wide line	WYDHL
ESC # ;	Display bottom half of double-high, single-wide line	WYDHL
ESC ,	Delay terminal processing	WYDELAY
ESC 5	Send cursor character	WYXCH
ESC 7	Save cursor position, attributes, character sets, wrap flag, and origin mode	DECSC
ESC 8	Restore cursor position, attributes, character sets, wrap flag, and origin mode	DECRC
ESC =	Select numeric keypad application mode	DECKPAM
ESC >	Select numeric keypad numeric mode	DECKPNM
ESC D	Move cursor down one line	IND
ESC E	Move cursor down one line and to column 1	NEL
ESC H	Set tab stop at cursor	HTS
ESC M	Move cursor up one line	RI
ESC N	Assign G2 character set to GL for next character only	SS2
ESC O	Assign G3 character set to GL for next character only	SS3
ESC Z	Request primary device attributes	DECID
ESC]	Ignore subsequent data	OSC
ESC ^	Ignore subsequent data	PM
ESC _	Ignore subsequent data	APC
ESC c	Hard terminal reset	RIS
ESC n	Assign G2 character set to GL	LS2
ESC o	Assign G3 character set to GL	LS3
ESC	Assign G3 character set to GR	LS3R
ESC }	Assign G2 character set to GR	LS2R
ESC ~	Assign G1 character set to GR	LS1R

Sequence	Description	Mnemonic
ESC <i>fcode scode</i>	Label character sets	SCS
IND	Move cursor down one line	IND
NEL	Move cursor down one line and to column 1	NEL
HTS	Set tab stop at cursor	HTS
RI	Move cursor up one line	RI
SS2	Assign G2 character set to GL for next character only	SS2
SS3	Assign G3 character set to GL for next character only	SS3
DCS \$ q <i>Ps</i> ST	Request control function selection or setting	DECRQSS
DCS 0 ! u % 5 ST	Assign Multinational as user-preferred supplemental character set	DECAUPSS
DCS 1 \$ p <i>ds...ds c1 c2</i> ST	Restore terminal state	DECRSTS
DCS 1 \$ s <i>ds...ds c1 c2</i> ST	Report terminal state	DECTSR
DCS 1 \$ t <i>ds...ds</i> ST	Restore cursor information	DECRSPS
DCS 1 \$ u <i>ds...ds</i> ST	Report cursor information	DECCIR
DCS 1 ! u A ST	Assign ISO Latin-1 as user-preferred supplemental character set	DECAUPSS
DCS 2 \$ t <i>ds...ds</i> ST	Restore tab stop information	DECRSPS
DCS 2 \$ u <i>ds...ds</i> ST	Report tab stop information	DECTABSR
DCS <i>Ps</i> \$ r <i>ds...ds Ps1</i> ST	Report control function selection or setting	DECRPSS
DCS <i>Ps ; Ps1 ; Ps2 kc/hc</i> ST	Program user-defined keys	WYUDK (DECUDK)
DCS 0 ; <i>Ps ; Pn } ds...ds</i> ST	Load softfont	WYLSFNT
DCS <i>Ps ; Ps1 ; Ps2 ; Ps3 ; Ps4 ; Ps5 ; Ps6 ; Ps7 { name Sxhp ; ... ; Sxhp</i> ST	Load softfont	DECDDL

Sequence	Description	Mnemonic
CSI ! p	Soft terminal reset	DECSTR
CSI 0 " q	Define erasable character	DECSCA
CSI 0 \$ }	Send data to screen's data area	DECSASD
CSI 0 \$ ~	Turn off top and bottom status line display	DECSSDT
CSI 0 J	Erase from cursor to end of display	ED
CSI 0 K	Erase from cursor to end of line	EL
CSI 0 W	Set tab stop at cursor	CTC
CSI 0 c	Request primary device attributes	DA
CSI 0 g	Clear tab stop at cursor	TBC
CSI 0 i	Print page	MC
CSI 0 t	Activate left or upper window	WYSWDW
CSI 0 v	Select full screen (for single session)	WYSSPLT
CSI 0 ; Pn y	Move horizontal split up <i>n</i> lines, or vertical split left <i>n</i> columns	WYMSPLM
CSI 0 z	Set 4 lps smooth scrolling speed	WYSCRATE
CSI 0	No form feed sent after send operation	DECTTC
CSI 1 " q	Define nonerasable character	DECSCA
CSI 1 \$ u	Request terminal state	DECROTSR
CSI 1 \$ w	Request cursor information	DECROPSR
CSI 1 \$ }	Send data to bottom (host-writable) status line	DECSASD
CSI 1 \$ ~	Display local (top) status line	DECSSDT
CSI 1 J	Erase from start of display to cursor	ED
CSI 1 K	Erase from start of line to cursor	EL
CSI 1 t	Activate left or upper window	WYSWDW
CSI 1 v	Split screen horizontally between two pages (single session)	WYSSPLT
CSI 1 z	Set 1 lps smooth scrolling speed	WYSCRATE
CSI 1 ; Pn y	Move horizontal split down <i>n</i> lines, or vertical split right <i>n</i> columns	WYMSPLM
CSI 1	Send form feed after send operation	DECTTC

Sequence	Description	Mnemonic
CSI 2 " q	Define erasable character	DECSCA
CSI 2 \$ w	Request tab stop information	DECQRPSR
CSI 2 \$ ~	Display top and bottom status line	DECSSDT
CSI 2 J	Erase entire display	ED
CSI 2 K	Erase entire line	EL
CSI 2 W	Clear tab stop at cursor	CTC
CSI 2 h	Lock keyboard	KAM
CSI 2 i	Send page	MC
CSI 2 l	Unlock keyboard	KAM
CSI 2 t	Activate right or lower window	WYSWDW
CSI 2 v	Split screen vertically between pages (single session)	WYSSPLT
CSI 2 z	Set 2 lps smooth scrolling speed	WYSCRATE
CSI 3 g	Clear all tab stops	TBC
CSI 3 h	Controls mode on	CRM
CSI 3 l	Controls mode off	CRM
CSI 3 z	Set 4 lps smooth scrolling speed	WYSCRATE
CSI 4 h	Insert mode on	IRM
CSI 4 i	Controller print mode off	MC
CSI 4 l	Insert mode off	IRM
CSI 4 z	Set 8 lps smooth scrolling speed	WYSCRATE
CSI 5 W	Clear all tab stops	CTC
CSI 5 i	Controller print mode on	MC
CSI 5 ; 1 i	Send host data to Aux port	MC
CSI 5 n	Request terminal status	DSR
CSI 6 i	PR receive mode off	MC
CSI 6 n	Request cursor position	DSR
CSI 7 i	PR receive mode on	MC
CSI 8 v	Split screen vertically between two pages (single session)	WYSSPLT

Sequence	Description	Mnemonic
CSI 12 h	Disable local echo	SRM
CSI 12 l	Enable local echo	SRM
CSI 13 h	Control execution off (display control codes)	FEAM
CSI 13 l	Execute control codes	FEAM
CSI 16 h	Send through cursor position	TTM
CSI 16 l	Send through end of line or end of screen	TTM
CSI 20 h	When LF, FF, or VT is received, cursor moves to first column of next line; return key sends CRLF	LNM
CSI 20 l	When LF, FF, or VT is received, cursor moves to current column of next line; return key sends CR	LNM
CSI 30 h	Turn display off	WYDSCM
CSI 30 l	Turn display on	WYDSCM
CSI 31 h	Display status line	WYSTLINM
CSI 31 l	Turn off status line display	WYSTLINM
CSI 32 h	Screen saver on	WYCRSAVM
CSI 32 l	Screen saver off	WYCRSAVM
CSI 33 h	Cursor steady	WYSTCURM
CSI 33 l	Cursor blinking	WYSTCURM
CSI 34 h	Underline cursor on	WYULCURM
CSI 34 l	Block cursor on	WYULCURM
CSI 35 h	Width change clear off	WYCLRM
CSI 35 l	Width change clear on	WYCLRM
CSI 36 h	Set delete key to BS/DEL	WYDELKM
CSI 36 l	Set delete key to DEL/CAN	WYDELKM
CSI 37 h	Send all characters	WYGATM
CSI 37 l	Send erasable characters only	WHGATM
CSI 38 h	Send full page	WYTEXM
CSI 38 l	Send scrolling region	WYTEXM
CSI 40 h	Extra data line	WYEXTDM

Sequence	Description	Mnemonic
CSI 40 l	Extra data line	WYEXTDM
CSI 42 h	Select Wyse 350 personality	WYASCII
CSI 48 ; <i>Ps</i> w	Select foreground color palette	WYCOLOR
CSI 49 ; <i>Ps</i> w	Select background color	WYCOLOR
CSI 50 w	Restore foreground and background colors to last saved in NVR	WYCOLOR
CSI 51 ; <i>Ps</i> w	Select border color	WYCOLOR
CSI 52 ; <i>Ps</i> w	Select cursor color	WYCOLOR
CSI 53 ; <i>Pn</i> w	Select overstrike position	WYSOVR
CSI 54 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> w	Select user status line attributes/colors	WYCOLOR
CSI 55 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> w	Select system status line attributes/colors	WYCOLOR
CSI 56 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> ; <i>Ps3</i> w	Select replacement character attributes/colors	WYCOLOR
CSI 57 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> w	Select nonerasable character attributes/colors	WYCOLOR
CSI 58 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> ; <i>Ps3</i> ; <i>Ps4</i> w	Set date and time	WYDTSET
CSI 59 ; <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> ; <i>Ps3</i> w	Define page for session	WYDFPG
CSI 60 w	Return color index values to default	WYIND
CSI 61 " p	Select VT100 personality	DECSCCL
CSI 61 ; <i>Ps</i> w	Change current character foreground color	WYIND
CSI 62 ; 1 " p	Select VT220 7-bit personality	DECSCCL
CSI 62 ; 2 " p	Select VT220 8-bit personality	DECSCCL
CSI 62 ; <i>Ps</i> w	Change current character background color	WYIND
CSI 63 ; 1 " p	Select VT320 7-bit personality	DECSCCL
CSI 63 ; 2 " p	Select VT320 8-bit personality	DECSCCL
CSI 63 ; <i>Ps</i> w	Turn color index mode on/off	WYIND
CSI 64 ; <i>Ps</i> w	Change current nonerasable character foreground color	WYIND

Sequence	Description	Mnemonic
CSI 65 ; <i>Ps</i> w	Change current nonerasable character background color	WYIND
CSI 66 ; <i>Ps</i> ; <i>PsI</i> w	Redefine color index value	WYIND
CSI 90 ; 0 " p	Select native (8-bit) personality	DECSCCL
CSI 90 ; 1 " p	Select native (7-bit) personality	DECSCCL
CSI 91 " p	Select Intecolor 220 personality	DECSCCL
CSI 93 " p	Select ADDS A2 personality	DECSCCL
CSI > 0 c	Request secondary device attributes	DA
CSI ? 0 J	Erase erasable characters from cursor to end of display	DECSED
CSI ? 0 K	Erase erasable characters from cursor to end of line	DECSEL
CSI ? 1 J	Erase erasable characters from start of display to cursor	DECSED
CSI ? 1 K	Erase erasable characters from start of line to cursor	DECSEL
CSI ? 1 h	Cursor keys send application-dependent codes	DECCKM
CSI ? 1 i	Print line	MC
CSI ? 1 l	Cursor keys send cursor movement codes	DECCKM
CSI ? 2 J	Erase erasable characters in entire display	DECSED
CSI ? 2 K	Erase erasable characters in entire line	DECSEL
CSI ? 2 l	Select VT52 personality	DECANM
CSI ? 3 h	132-column display	DECCOLM
CSI ? 3 i	Send line	MC
CSI ? 3 l	80-column display	DECCOLM
CSI ? 4 h	Smooth scrolling on	DECSCLM
CSI ? 4 i	Autoprint mode off	MC
CSI ? 4 l	Jump scrolling on	DECSCLM
CSI ? 5 W	Set tab stop every 8th column	CTC
CSI ? 5 h	Reverse screen	DECSCNM
CSI ? 5 i	Autoprint mode on	MC
CSI ? 5 l	Normal screen	DECSCNM

Sequence	Description	Mnemonic
CSI ? 6 h	Line 1 is top line of scrolling region	DECOM
CSI ? 6 l	Line 1 is top line of data area	DECOM
CSI ? 7 h	Autowrap on	DECAWM
CSI ? 7 l	Autowrap off	DECAWM
CSI ? 8 h	Key autorepeat on	DECARM
CSI ? 8 l	Key autorepeat off	DECARM
CSI ? 10 h	Block mode on	DECEDM
CSI ? 10 l	Block mode off	DECEDM
CSI ? 15 n	Request printer status	DSR
CSI ? 18 h	Send form feed after print operation	DECPFF
CSI ? 18 l	No form feed sent after print operation	DECPFF
CSI ? 19 h	Print full page	DECPEX
CSI ? 19 l	Print scrolling region	DECPEX
CSI ? 25 h	Display cursor	DECTCEM
CSI ? 25 l	Cursor invisible	DECTCEM
CSI ? 25 n	Request function key definition lock	DSR
CSI ? 26 n	Request keyboard language	DSR
CSI ? 38 h	Select TEK 4010/4014 personality	WYTEK
CSI ? 42 h	National replacement character set mode on	DECNRCM
CSI ? 42 l	National replacement character set mode off	DECNRCM
CSI ? 60 h	Display pans horizontally to keep cursor in view	DECHCCM
CSI ? 60 l	Cursor disappears when moved past right or left margin	DECHCCM
CSI ? 61 h	Display pans vertically to keep cursor in view	DECVCCM
CSI ? 61 l	Cursor disappears when moves past top or bottom line	DECVCCM
CSI ? 64 h	New page is displayed to keep cursor in view	DECPCCM
CSI ? 64 l	Cursor disappears when moved to new page	DECPCCM
CSI ? 66 h	Numeric keypad application mode on	DECNKM

Sequence	Description	Mnemonic
CSI ? 66 l	Numeric keypad numeric mode on	DECNKM
CSI ? 67 h	Set delete key to BS/DEL	DECBKM
CSI ? 67 l	Set delete key to DEL/CAN	DECBKM
CSI ? 68 h	Keys send data processing values	DECKBUM
CSI ? 68 l	Keys send typewriter values	DECKBUM
CSI ? 80 h	161-column display	WY161
CSI ? 80 l	80-column display	WY161
CSI ? 83 h	52-line display	WY52
CSI ? 83 l	24-line display	WY52
CSI ? 84 h	Enable separate assignment of attributes (SGR) to erasable and nonerasable characters	WYENAT
CSI ? 84 l	Enable attribute assignment (SGR) to extend to both erasable and nonerasable characters	WYENAT
CSI ? 85 h	Set replacement character to current character background color	WYREPL
CSI ? 85 l	Set replacement character to color map background color	WYREPL
CSI ? <i>Ps</i> \$ p	Request functional mode status	DECRQM
CSI ? <i>Ps</i> ; <i>PsI</i> \$ y	Report functional mode status	DECRPM
CSI s	Save cursor position, attributes, character sets, wrap flag, and origin mode	WYSC
CSI u	Restore last saved cursor position, attributes, character sets, wrap flag, and origin mode	WYRC
CSI <i>Pn</i> ; 0 SP P	Address cursor to same line and column on specified page	PPA
CSI <i>Pn</i> ; 1 SP P	Address cursor to position last occupied on specified page	WYPPA
CSI <i>Pn</i> ; 0 SP Q	Address cursor to same line and column position on a following page	PPR
CSI <i>Pn</i> ; 1 SP Q	Address cursor to position last occupied on a following page	WYPPR

Sequence	Description	Mnemonic
CSI <i>Pn</i> ; 0 SP R	Address cursor to same line and column position on a preceding page	PPB
CSI <i>Pn</i> ; 1 SP R	Address cursor to position last occupied on a preceding page	WYPPB
CSI <i>Pn</i> @	Insert <i>n</i> blank characters beginning at cursor	ICH
CSI <i>Pn</i> A	Move cursor up <i>n</i> lines	CUU
CSI <i>Pn</i> B	Move cursor down <i>n</i> lines	CUD
CSI <i>Pn</i> C	Move cursor right <i>n</i> columns	CUF
CSI <i>Pn</i> D	Move cursor left <i>n</i> columns	CUB
CSI <i>Pn</i> E	Move cursor down <i>n</i> lines and to column 1	CNL
CSI <i>Pn</i> F	Move cursor up <i>n</i> lines and to column 1	CPL
CSI <i>Pn</i> G	Move cursor to column <i>n</i>	CHA
CSI <i>Pn</i> ; <i>Pn</i> H	Move cursor to line <i>n</i> , column <i>n</i>	CUP
CSI <i>Pn</i> I	Move forward <i>n</i> tab stops	CHT
CSI <i>Pn</i> L	Insert <i>n</i> blank lines beginning at cursor line	IL
CSI <i>Pn</i> M	Delete <i>n</i> lines beginning at cursor line	DL
CSI <i>Pn</i> P	Delete <i>n</i> characters beginning at cursor	DCH
CSI <i>Pn</i> S	Move window down <i>n</i> lines in page	SU
CSI <i>Pn</i> T	Move window up <i>n</i> lines in page	SD
CSI <i>Pn</i> V	Display preceding page and home cursor	PP
CSI <i>Pn</i> X	Erase <i>n</i> characters beginning at cursor	ECH
CSI <i>Pn</i> Z	Move backward <i>n</i> tab stops	CBT
CSI <i>Pn</i> U	Display a following page and home cursor	NP
CSI <i>Pn</i> V	Display a preceding page and home cursor	PP
CSI <i>Pn</i> \	Move cursor to column <i>n</i>	HPA
CSI <i>Pn</i> a	Move cursor right <i>n</i> columns	HPR
CSI <i>Pn</i> d	Move cursor to line <i>n</i>	VPA
CSI <i>Pn</i> e	Move cursor down <i>n</i> lines	VPR
CSI <i>Pn</i> ; <i>Pn</i> l f	Move cursor to line <i>n</i> , column <i>n</i>	HVP

Sequence	Description	Mnemonic
CSI <i>Pn</i> ; <i>Pn1</i> r	Define scrolling region	DECSTBM
CSI <i>Ps</i> ; <i>Pn</i> ; <i>Pn1</i> p	Draw a box	WYDRBX
CSI <i>Ps</i> \$ p	Request functional mode status	DECROQM
CSI <i>Ps</i> ; <i>Ps1</i> \$ y	Report functional mode status	DECROPM
CSI <i>Ps</i> ;...; <i>Ps</i> m	Define character attributes	SGR
CSI <i>Ps</i> ; <i>Pn</i> ; <i>Pn1</i> o	Clear a box	WYCLBX
CSI <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> ; <i>Ps3</i> w	Redefine character display attribute association	WYCAA
CIS <i>Ps</i> ; <i>Ps1</i> ; <i>Ps2</i> x	Set current character attributes/color	WYCDIR
OSC PM APC	Ignore subsequent data	OSC PM APC

Command Index

Mnemonic	Command	Page
APC	Ignore subsequent data	2-12
BEL	Sound bell	2-12
BS	Backspace cursor	7-3
CAN	Abort escape sequence	2-12
CBT	Tab cursor backward	8-5
CHA	Cursor to column <i>n</i>	7-1
CHT	Tab cursor forward	8-5
CNL	Cursor down <i>n</i> lines/column 1	7-3
CPL	Cursor up <i>n</i> lines/column 1	7-3
CR	Carriage return	7-3
CRM	Monitor	2-9
CTC	Set/clear tab stop	8-4
CUB	Cursor left	7-2
CUD	Cursor down	7-1
CUF	Cursor right	7-2
CUP	Cursor to specific line/column	7-2
CUU	Cursor up	7-1
DA	Request device attributes	10-1
DC1	Resume transmission (XON)	9-3
DC3	Suspend transmission (XOFF)	9-3
DCH	Delete character	8-4
DECALN	Screen adjustment pattern	2-14
DECANM	ANSI/VT52	2-9
DECARM	Key autorepeat	2-6
DECAUPSS	Assign user-preferred supplemental set	4-3
DECAWM	Autowrap	2-4
DECBKM	Delete key redefinition	2-6
DECCIR	Report cursor information	10-5
DECCKM	Cursor key application mode	2-6
DECCOLM	132-column display	2-4
DECDHL	Double-high/double-wide line	5-29
DECDLD	Load softfont	4-15

Mnemonic	Command	Page
DECDWL	Single-high/double-wide line	5-29
DECEDM	Block mode	2-8
DECHCCM	Horizontal panning	2-7
DECID	Request terminal ID	10-2
DECKBUM	Key legend	2-7
DECKPAM	Keypad application mode	3-4
DECKPNM	Keypad numeric mode	3-4
DECNKM	Keypad application mode	2-7
DECNRCM	National replacement character set	2-7
DECOM	Origin mode	2-4
DECPCCM	Page coupling	2-7
DECPEX	Print extent	2-8
