TYPICAL TRACK - SECTOR FORMAT

DISK AND CONTROLLER

The disk controller is designed to accommodate one of a variety of DIABLO disk drives, including models 31 and 44. Each drive accommodates one or two disks. Each drive has two heads, one per side. Information is recorded on each disk in a 12-sector format on each of up to 406 (depending on the disk model) radial track positions. Thus each disk contains up to 9744 recording positions (2 heads X 12 sectors X 406 track positions). Figure 1 tabulates various useful information about the performance of the disk drives.

*The notation dt stands for the number of tracks traveled during the seek.

FIGURE 1

The disk controller records three independent data blocks in each sector. The first is two words long, and is intended to include the address of the sector. This block is called the Header block. The second block is eight words long, and is called the Label block. The third block is 256 words long, and is the Data block. Each block may be independently read, written, or checked, except that writing, once begun, must continue until the end of the sector.

When a block is checked, information on the disk is compared word for word with a specified block of main memory. During checking, a main memory word containing 0 has special significance. When this word is encountered, the matching word read from the disk is stored in its place and does not take part in the check. This feature permits a combination of reading and checking to occur in the same block. (It also has the drawback of making it impossible to use the disk controller to check for words containing 0 on the disk).

The Alto program communicates with the disk controller via a four-word block of main memory. The first word is interpreted as a pointer to a chain of disk command blocks. If it contains 0, the disk controller will remain idle. Otherwise, the disk controller will commence execution of the command contained in the first disk command block. When a command is completed successfully, the disk controller stores a pointer to the next command in the chain and the cycle repeats. If a command terminates in error, a 0 is immediately stored and the disk controller idles. At the beginning of each sector, status information, including the number of the current sector, is stored. This can be used by the Alto program to sense the readiness of the disk and to schedule disk transfers, for example. When the disk controller begins executing a command, it stores the disk address of that command. This information is later used by the disk controller to decide whether seek operations or disk switches are necessary. It can be used by the Alto program for scheduling disk arm motion. If the Alto program stores an illegal disk address (like -1) in this word, the disk controller will perform a seek at the beginning of the next disk operation. (This is useful, for example, when a disk driver wants to force a restore operation). The disk controller also communicates with the Alto program by interrupts.

A disk command block is a ten-word block of memory which describes a disk transfer operation to the disk controller, and which is also used by the controller to record the status of that operation. The first word is a pointer to the next disk command block in this chain. A 0 means that this is the last disk command block in the chain. When the command is complete, the disk controller stores its status in the second word. The third word contains the command itself, telling the disk controller what to do. The fourth word contains a pointer to the block of memory from/to which the header block will be transferred. The fifth word contains a similar pointer for the label block. The sixth word contains a similar pointer for the data block.

The seventh and eighth words of the disk command block control the initiation of interrupts when the command block is finished.

The ninth word is unused by the disk controller, and may be used by the Alto program to facilitate chained disk operations. The tenth word contains the disk address at which the current operation is to take place.

- DCB: Pointer to next command block.
- DCB+1: Status.
- DCB+2: Command.
- DCB+3: Header block pointer.
- DCB+4: Label block pointer.
- DCB+5: Data pointer.
- DCB+6: Command complete no-error interrupt bit mask.
- DCB+7: Command complete error interrupt bit mask.
- DCB+8: Currently unused.
- DCB+9: Disk address.

A disk address word A contains the following fields:

<u>FIELD</u>	<u>RANGE</u>	<u>SIGNIFICANCE</u>
A[0-3]	0-13B	Sector number.
A[4-12]	0-625B (Model 44) 0-312B (Model 31)	Cylinder number.
A[13]	0-1	Head number.

<u>FIELD</u>	<u>RANGE</u>	<u>SIGNIFICANCE</u>
A[14]	0-1	Disk number (see also C[15]). 0 is removable pack on Model 44. 1 is optional second Model 31 drive.
A[15]	0-1	0 normally. 1 if cylinder 0 is to be addressed via a hardware "restore" operation.

A disk command word C contains the following fields:

<u>FIELD</u>	<u>RANGE</u>	<u>SIGNIFICANCE</u>
C[0-7]	110B	Checked to verify that this is a valid disk command.
C[8-9]	0-3	0 if Header block to be read. 1 if Header block to be checked. 2 or 3 if Header block to be written.
C[10-11]	0-3	0 if Label block to be read. 1 if Label block to be checked. 2 or 3 if Label block to be written.
C[12-13]	0-3	0 if Data block to be read. 1 if Data block to be checked. 2 or 3 if Data block to be written.
C[14]	0-1	0 normally. 1 if the command is to terminate immediately after the correct cylinder position is reached (before any data is transferred).
C[15]	0-1	XOR'ed with A[14] to yield hardware disk number.

A disk status word S has the following fields:

<u>FIELD</u>	<u>VALUES</u>	<u>SIGNIFICANCE</u>
S[0-3]	0-13B	Current sector number.
S[4-7]	17B	One can tell whether status has been stored by setting this field initially to 0 and then checking for non-zero.
S[8]	0-1	1 means seek failed, possibly due to illegal cylinder address.
S[9]	0-1	1 means seek in progress.
S[10]	0-1	1 means disk unit not ready.

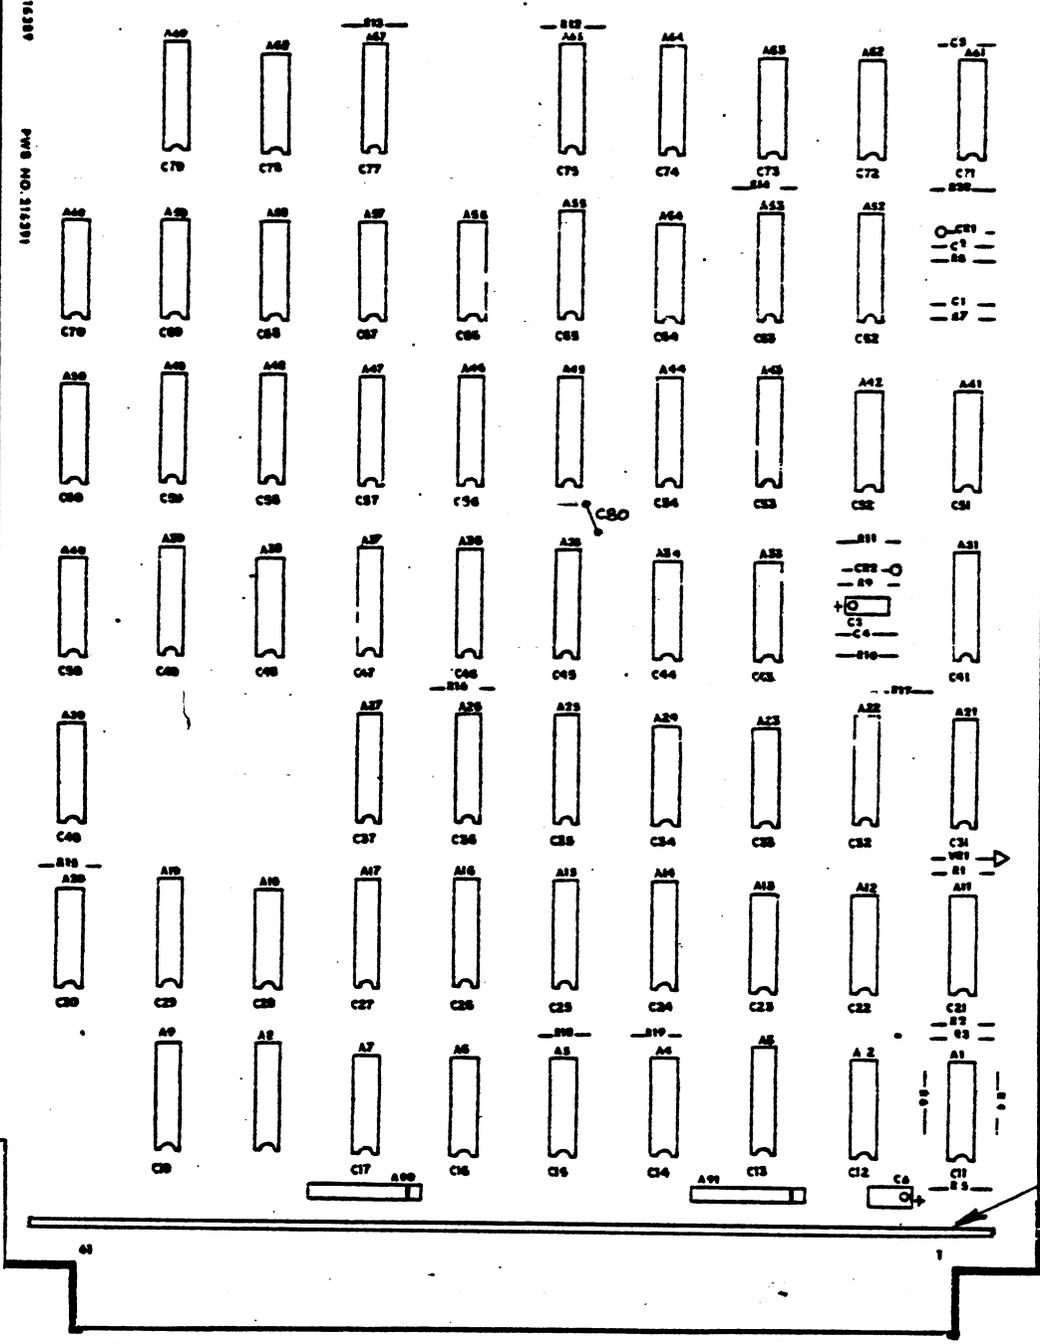

<u>FIELD</u>	<u>VALUES</u>	<u>SIGNIFICANCE</u>
S[11]	0-1	1 means data for sector processing was late during the last sector. Data and current sector number unreliable.
S[12]	0-1	1 means disk interface was not transferring data last sector.
S[13]	0-1	1 means checksum error. Command allowed to proceed.
S[14-15]	0-3	0 means command completed correctly. 1 means hardware error (see S[8-11]) or sector overflow. 2 means check error. Command terminated instantly. 3 means disk command specified illegal sector.

**MODEL 31 DISC DRIVE
DATA GATE RETROFIT OF J10 MODULE**

1) TO CHECK THE DATA GATE

A) SCOPE CONNECTIONS AND SETUP AS FOLLOWS (TEKTRONIX MODEL 465):

CHANNEL # 1 AT TP3 ON J10 MODULE

CHANNEL # 1 VOLTS PER DIVISION AT 2.0

CHANNEL # 2 AT TP5 ON J10 MODULE

CHANNEL # 2 VOLTS PER DIVISION AT 2.0

TIME PER DIVISION AT .05 micro. sec.

TRIGGER ON: CHANNEL # 1 (-) SLOPE

B) LOAD SCRATCH PACK AND BRING UP TO READY STATE.

C) POSITION CHANNEL # 1 SCOPE TRACE SO THAT THE 50% POINT OF THE FALLING EDGE IS ON THE LEFT SIDE OF THE SCOPE DISPLAY.

D) THERE SHOULD BE TWO FALLING EDGES OF CHANNEL # 2'S SCOPE TRACE. THE 50% POINT OF FALLING EDGES SHOULD BE APPROXIMATELY 440 nsec. AND 460 nsec.

NOTE: THE FACTORY SETS THE DATA GATE AT 450 nsec. AND 470 nsec. BUT SPG MANUFACTURING MODIFIES THIS TO APPROXIMATELY 440 nsec. AND 460 nsec.

2) TO VERIFY IF DATA GATE IS CORRECT

A) BOOT DIEX, EITHER FROM THE NET OR DISC PACK. ENABLE WRITING.

B) LOAD SCRATCH PACK AND BRING UP TO READY STATE.

C) RUN DIEX AS YOU NORMALLY WOULD TO CHECK OUT THE MODEL 31 DISC DRIVE.

WHILE RUNNING "INIT FULL TEST" MONITOR THE DATA GATE AND VERIFY THAT DURING THE READ PASS THE SCOPE PRESENTATION IS NOT JUMPING AROUND. CHECKSUM ERRORS (04 ERRORS) THAT OCCUR AND ARE TOTALLY RANDOM WITH REGARDS TO CYLINDER, HEAD, AND SECTOR COULD BE CONSIDERED AS ERRORS CAUSED BY AN INCORRECT DATA GATE.

3) TO MODIFY THE DATA GATE

A) NOTE THE VALUES OF RESISTORS H53 AND F28

B) TO INCREASE THE TIME OF THE DATA GATE, RESISTORS H53 AND F28 NEED TO BE DECREASED IN VALUE.

C) FIND SOME RESISTORS THAT ARE STANDARD VALUES ABOVE OR BELOW THE VALUE NOTED IN STEP A. REPLACE RESISTORS H53 AND F28 WITH THE APPROPRIATE VALUE RESISTORS.

D) RETEST THE DATA GATE TO INSURE IT IS CORRECT.
